### Core Photo

Hole 323-U1344A Core 4H, Interval 28.1-38.22m (CSF-A)

Major lithologies: dark greenish gray diatom-bearing clayey silt and very dark greenish gray diatom-rich silt grade into one another over the course of 100 cm. Two very thin dark ash layers or lenses are present. One large pebble was found in the diatom-rich silt. The core is mottled throughout with pyrite specks and streaks as well as green mottles. Wood and worm tubes are found. The worm tubes are filled with fine pyrite crystals. Gas expansion is slight to moderate throughout with small cracks.

### Core Photo

### Core Photo

Hole 323-U1344A Core 6H, Interval 47.1-57.29m (CSF-A)

Major lithologies: Soft, dark gray to very dark greenish gray to dark greenish gray diatom silt, diatom-rich silt and diatom-bearing clayey silt; foraminifer-rich diatom-rich clayey silt interval in lower section 5; sponge spicule aggregates in sections 1, 2, 4 and 7; sandy mottles in sections 2, 5, 6 and 7; authigenic carbonate patches in lower section 4; slight to moderate bioturbation; slight gas expansion, heavy drilling disturbance in section 1, moderate in CC

### Core Photo

Hole 323-U1344A Core 24H, Interval 218.1-226.67m (CSF-A)

Main lithology is greenish black diatom-rich sandy silt with minor authigenic carbonate-rich layers. There is a fining upward sand layer in section 6 with a sharp base and bioturbated top and a clast in section 5. Bioturbation is slight to absent and there are gas expansion cracks throughout the core.

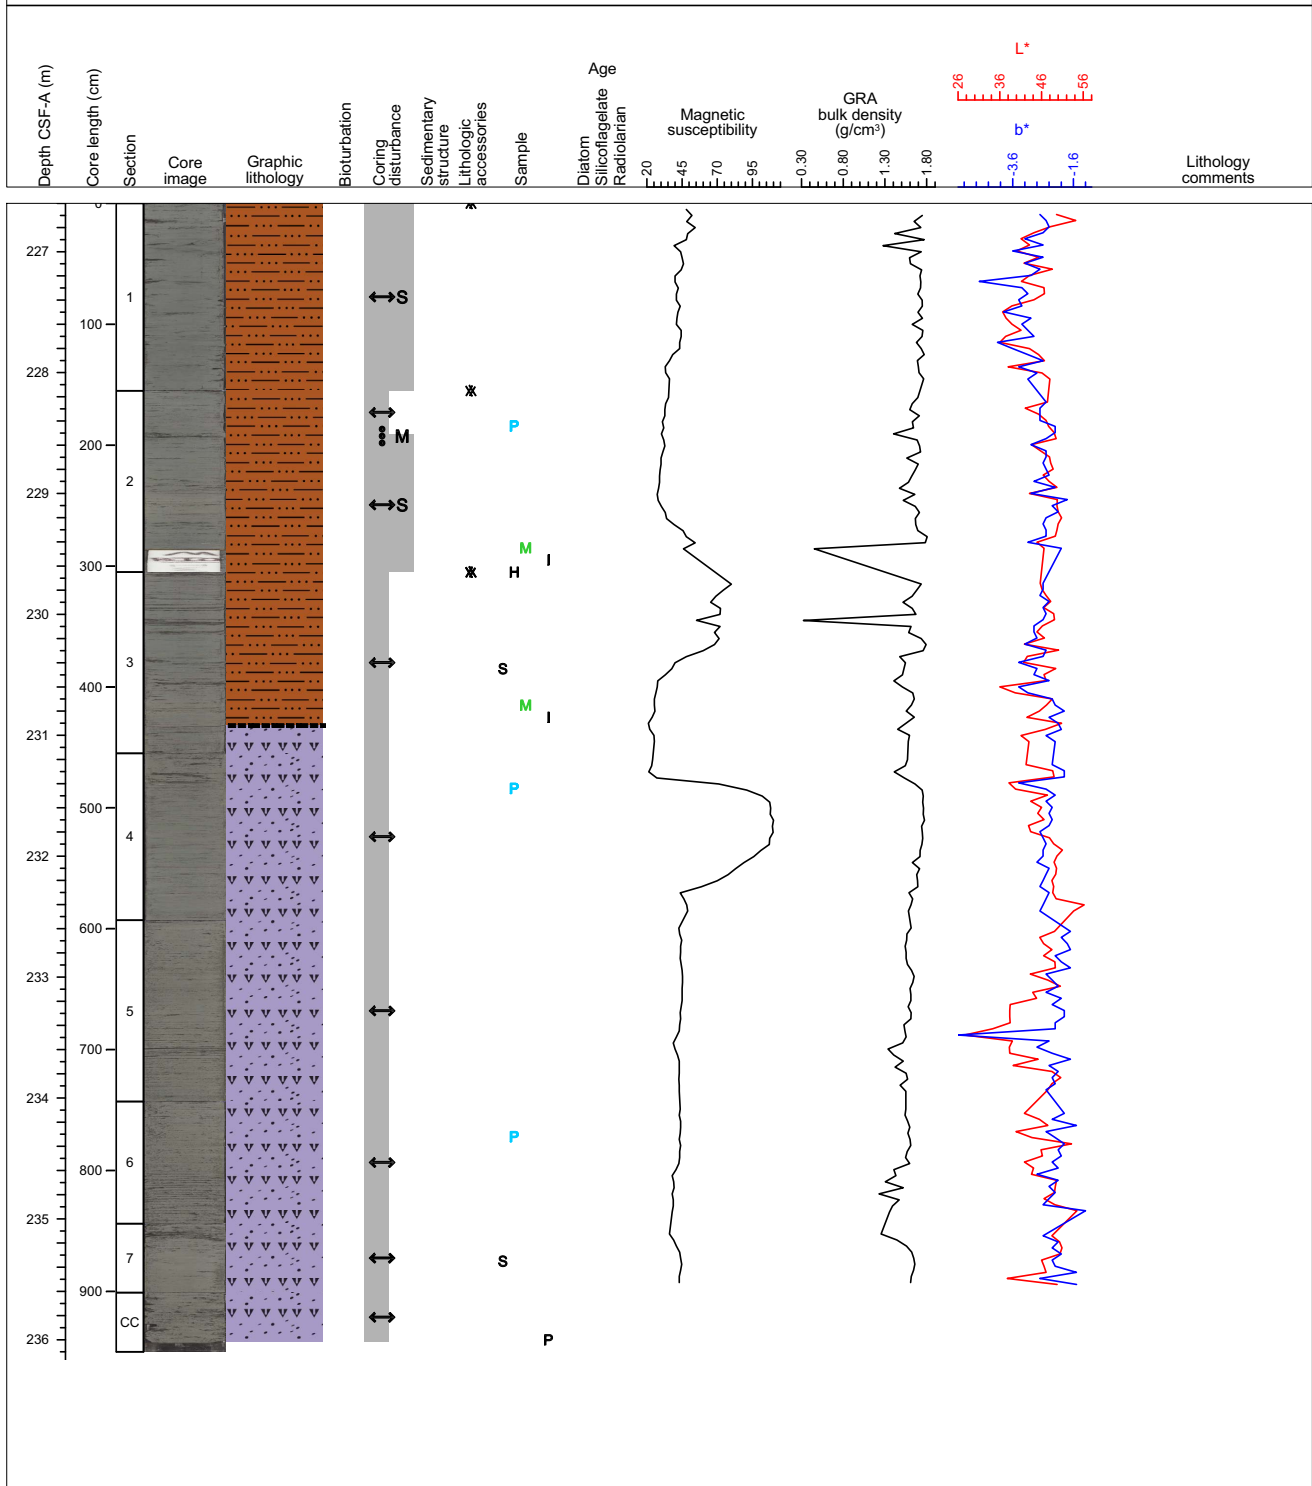

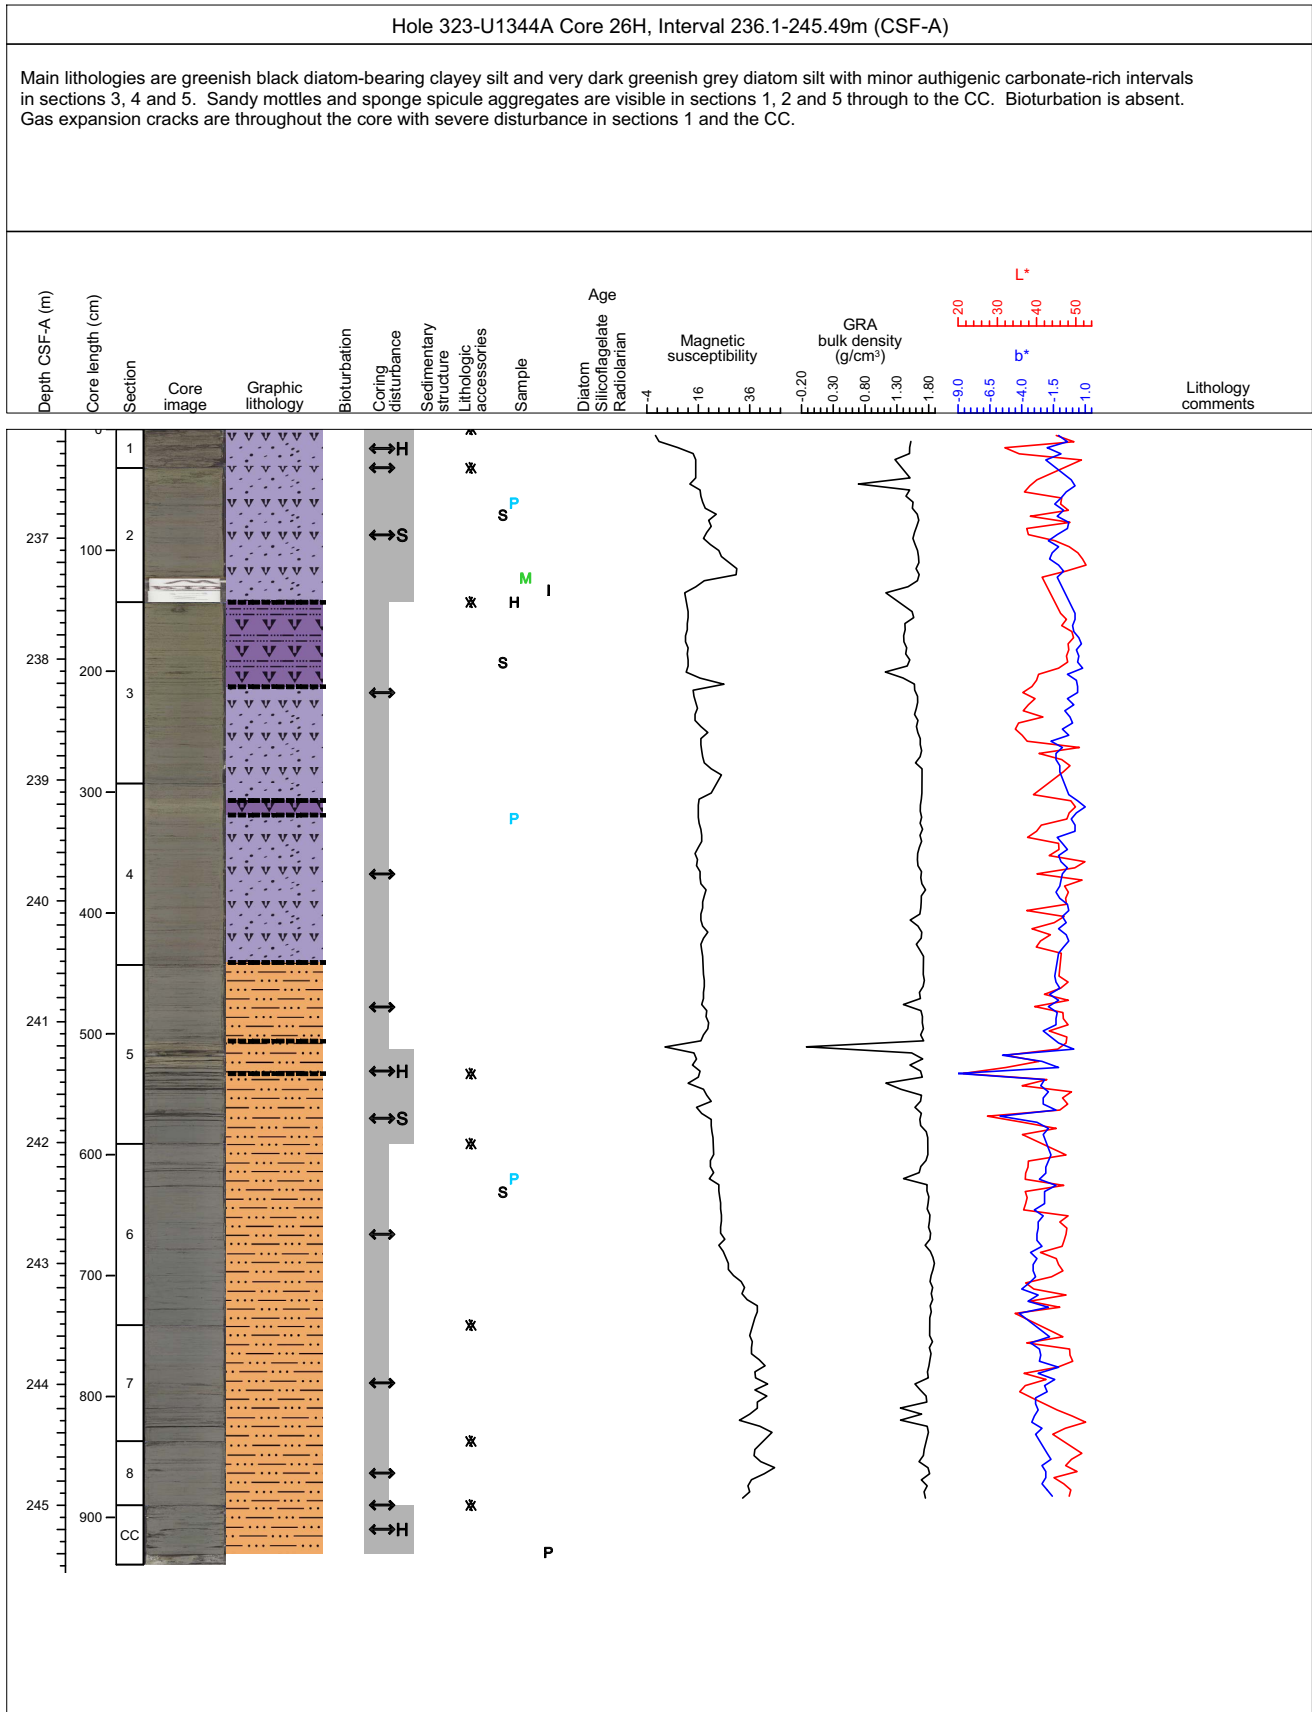

### Core Photo

Hole 323-U1344A Core 25H, Interval 226.6-236.1m (CSF-A)

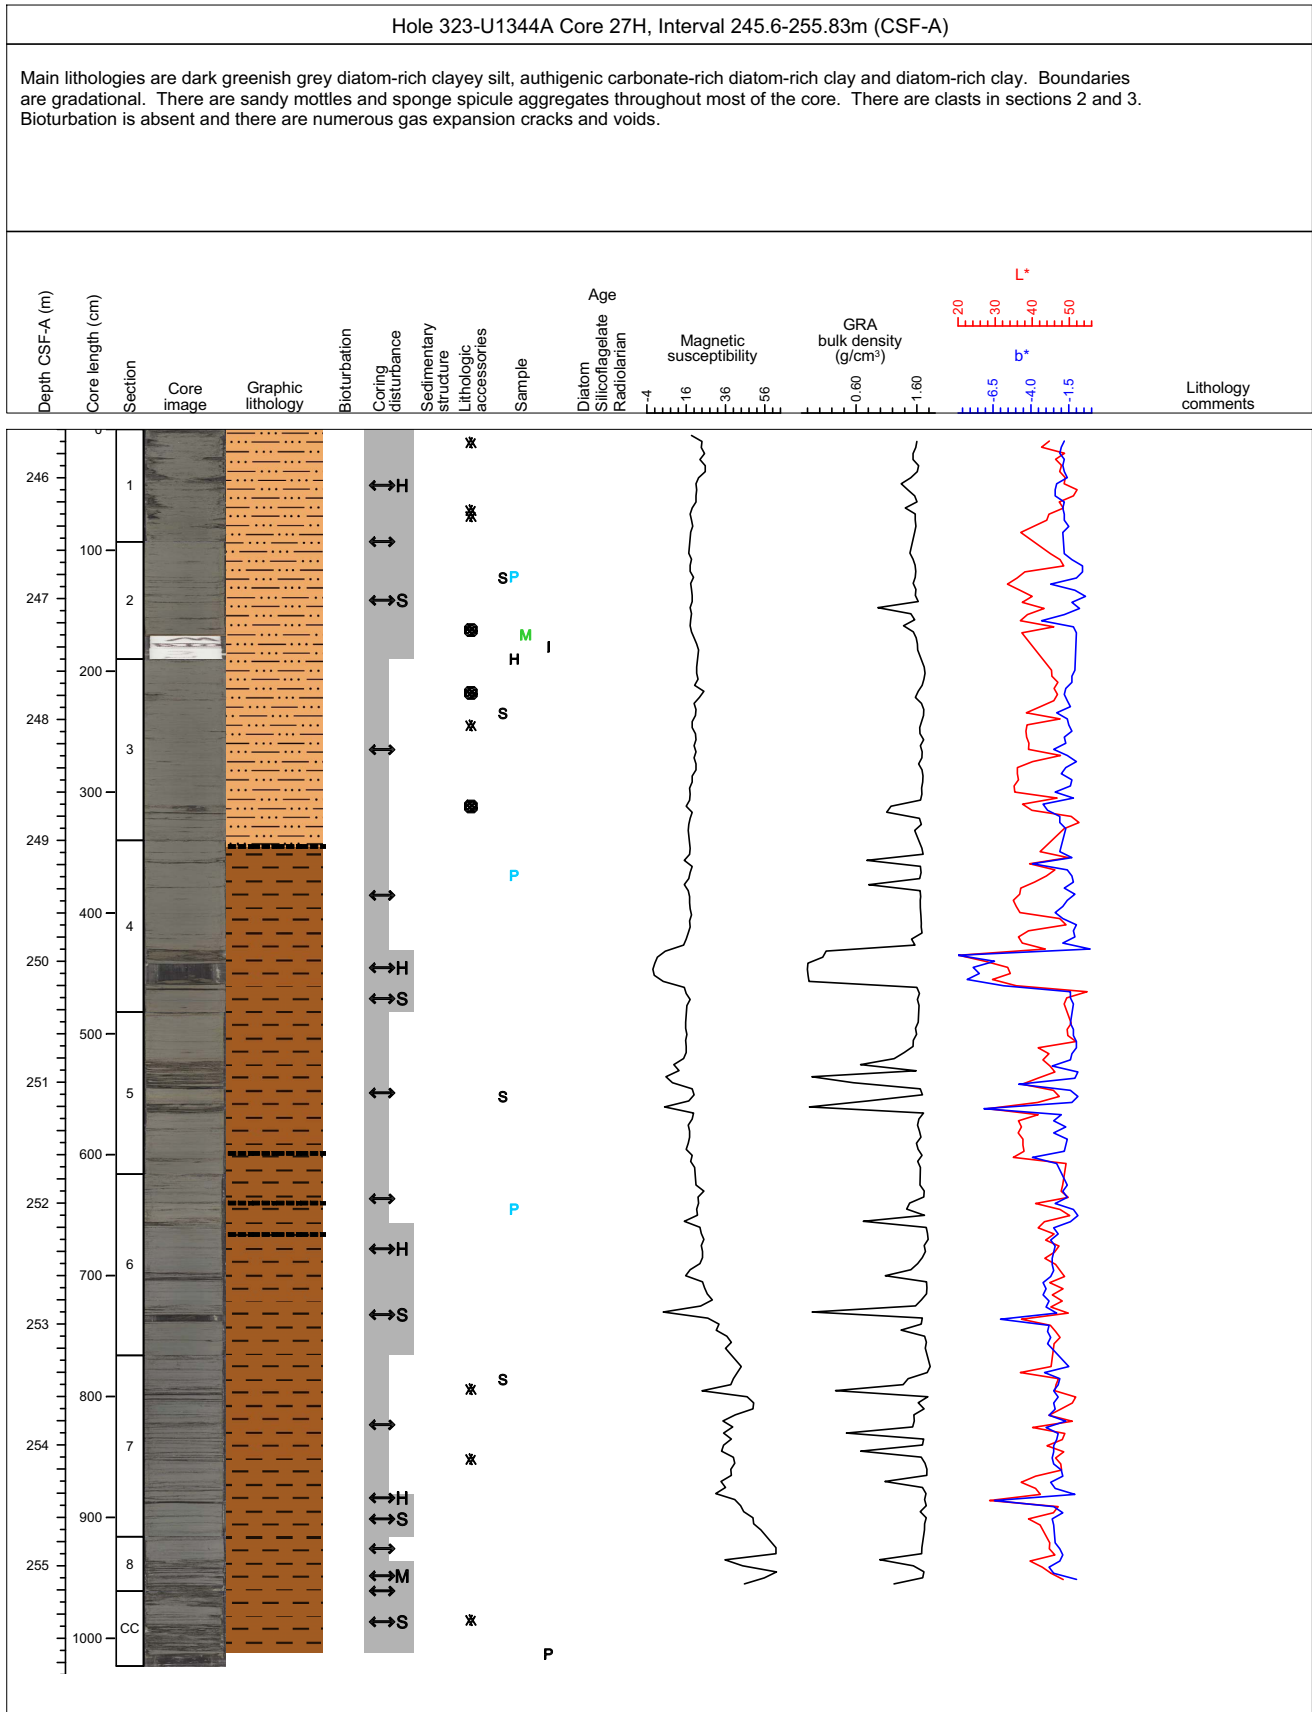

Main lithologies are very dark grey diatom-rich silty clay and diatom silt. The boundary is gradational. There are sponge spicule aggregates and sandy mottles as well as black streaky mottles in sections 1 to 3 but these are rare below. Bioturbation is absent and drilling disturbance is slight except for a soupy interval of 2 cm in section 2.

### Core Photo

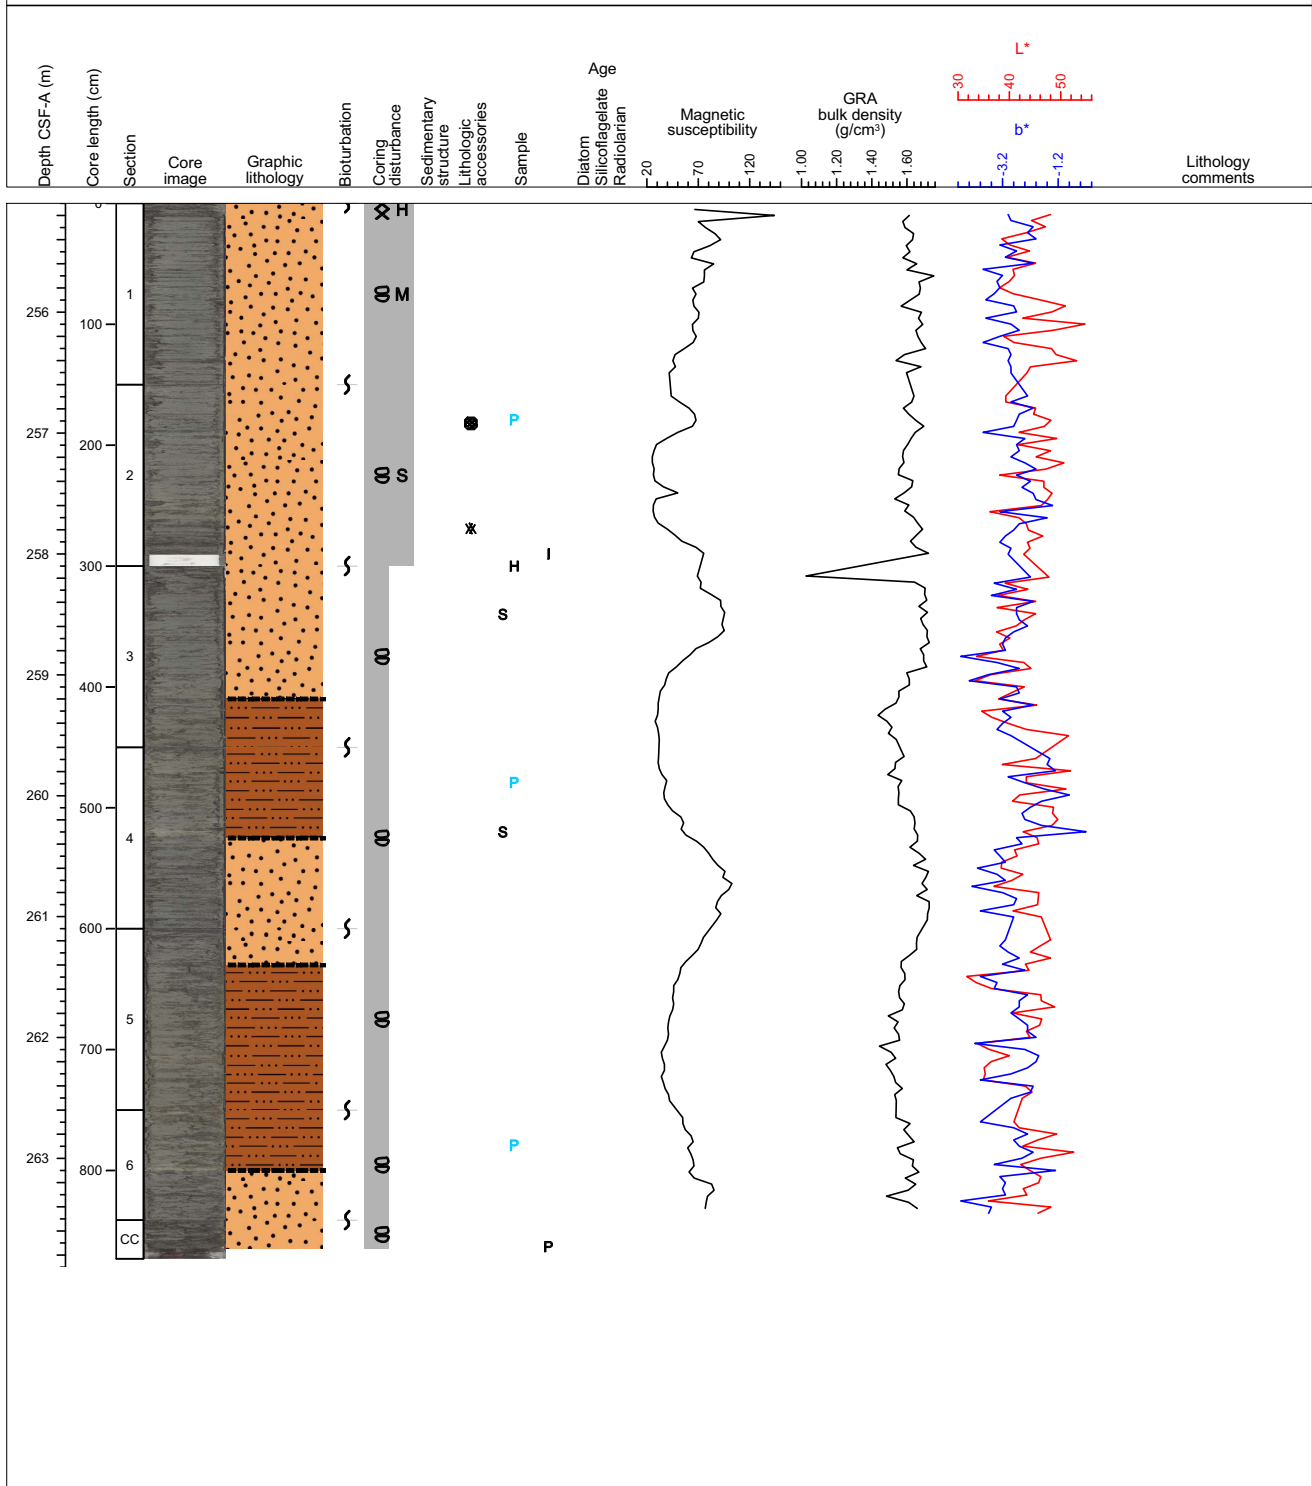

### Core Photo

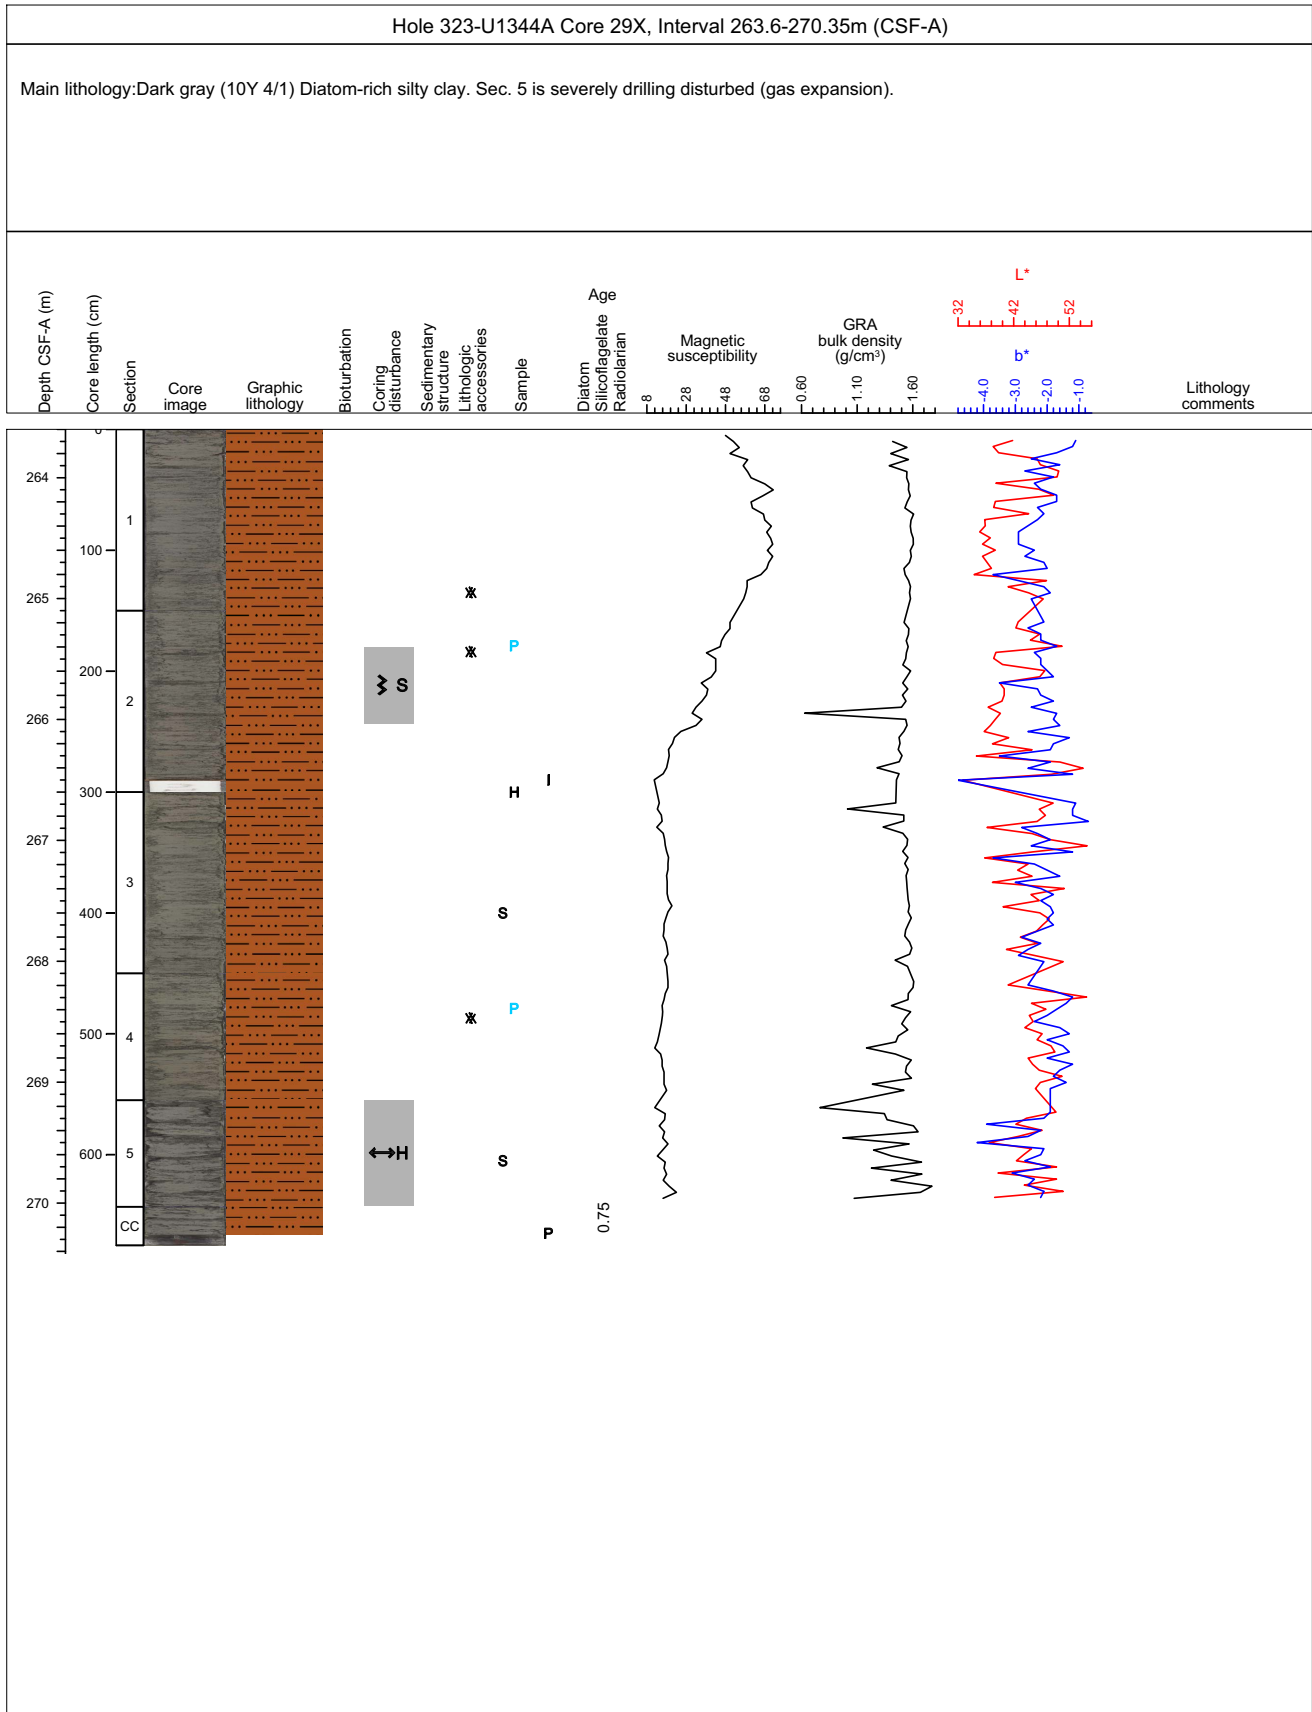

### Core Photo

Hole 323-U1344A Core 28X, Interval 255.1-263.83m (CSF-A)

Main lithology is diatom rich silt. Secondary lithology is auth. carb. diatom rich silty clay. Auth. carb. diatom rich silty clay is situated Sec. 3-6. Drilling disturbance (biscuits) occurs throughout the core. Slightly bioturbated.

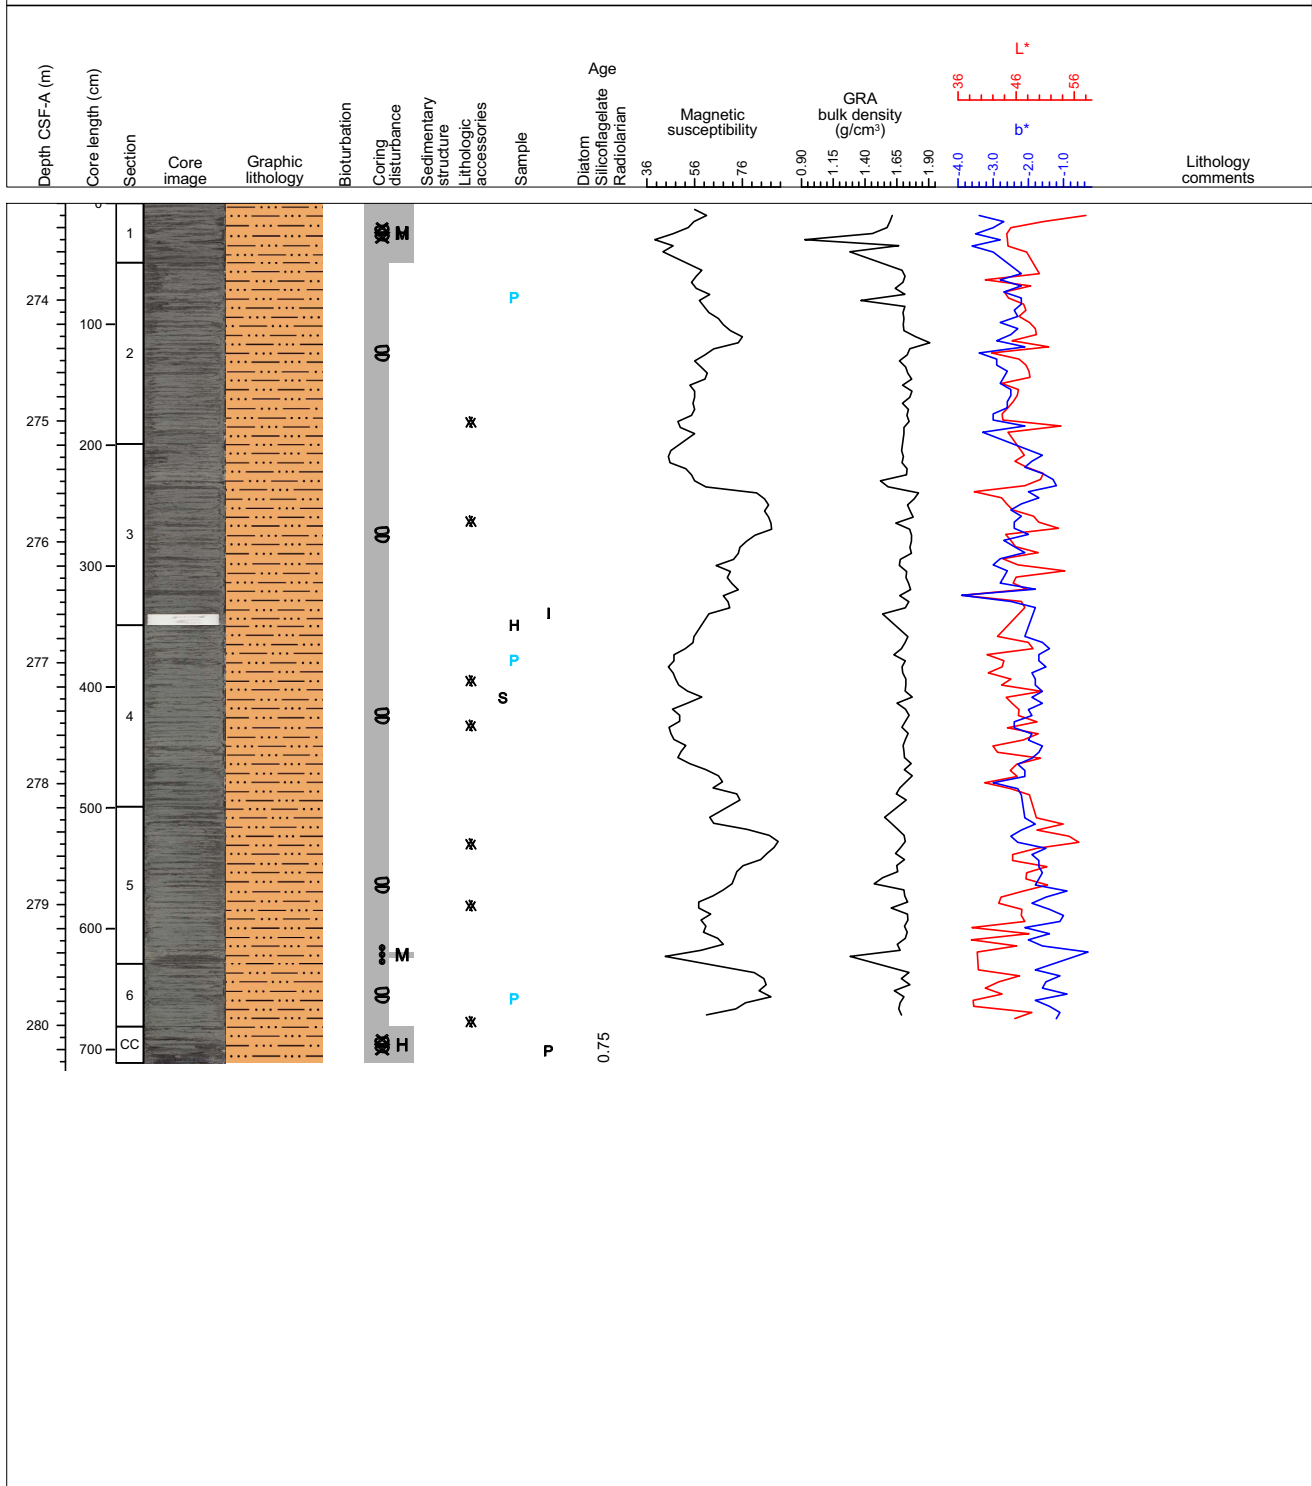

### Core Photo

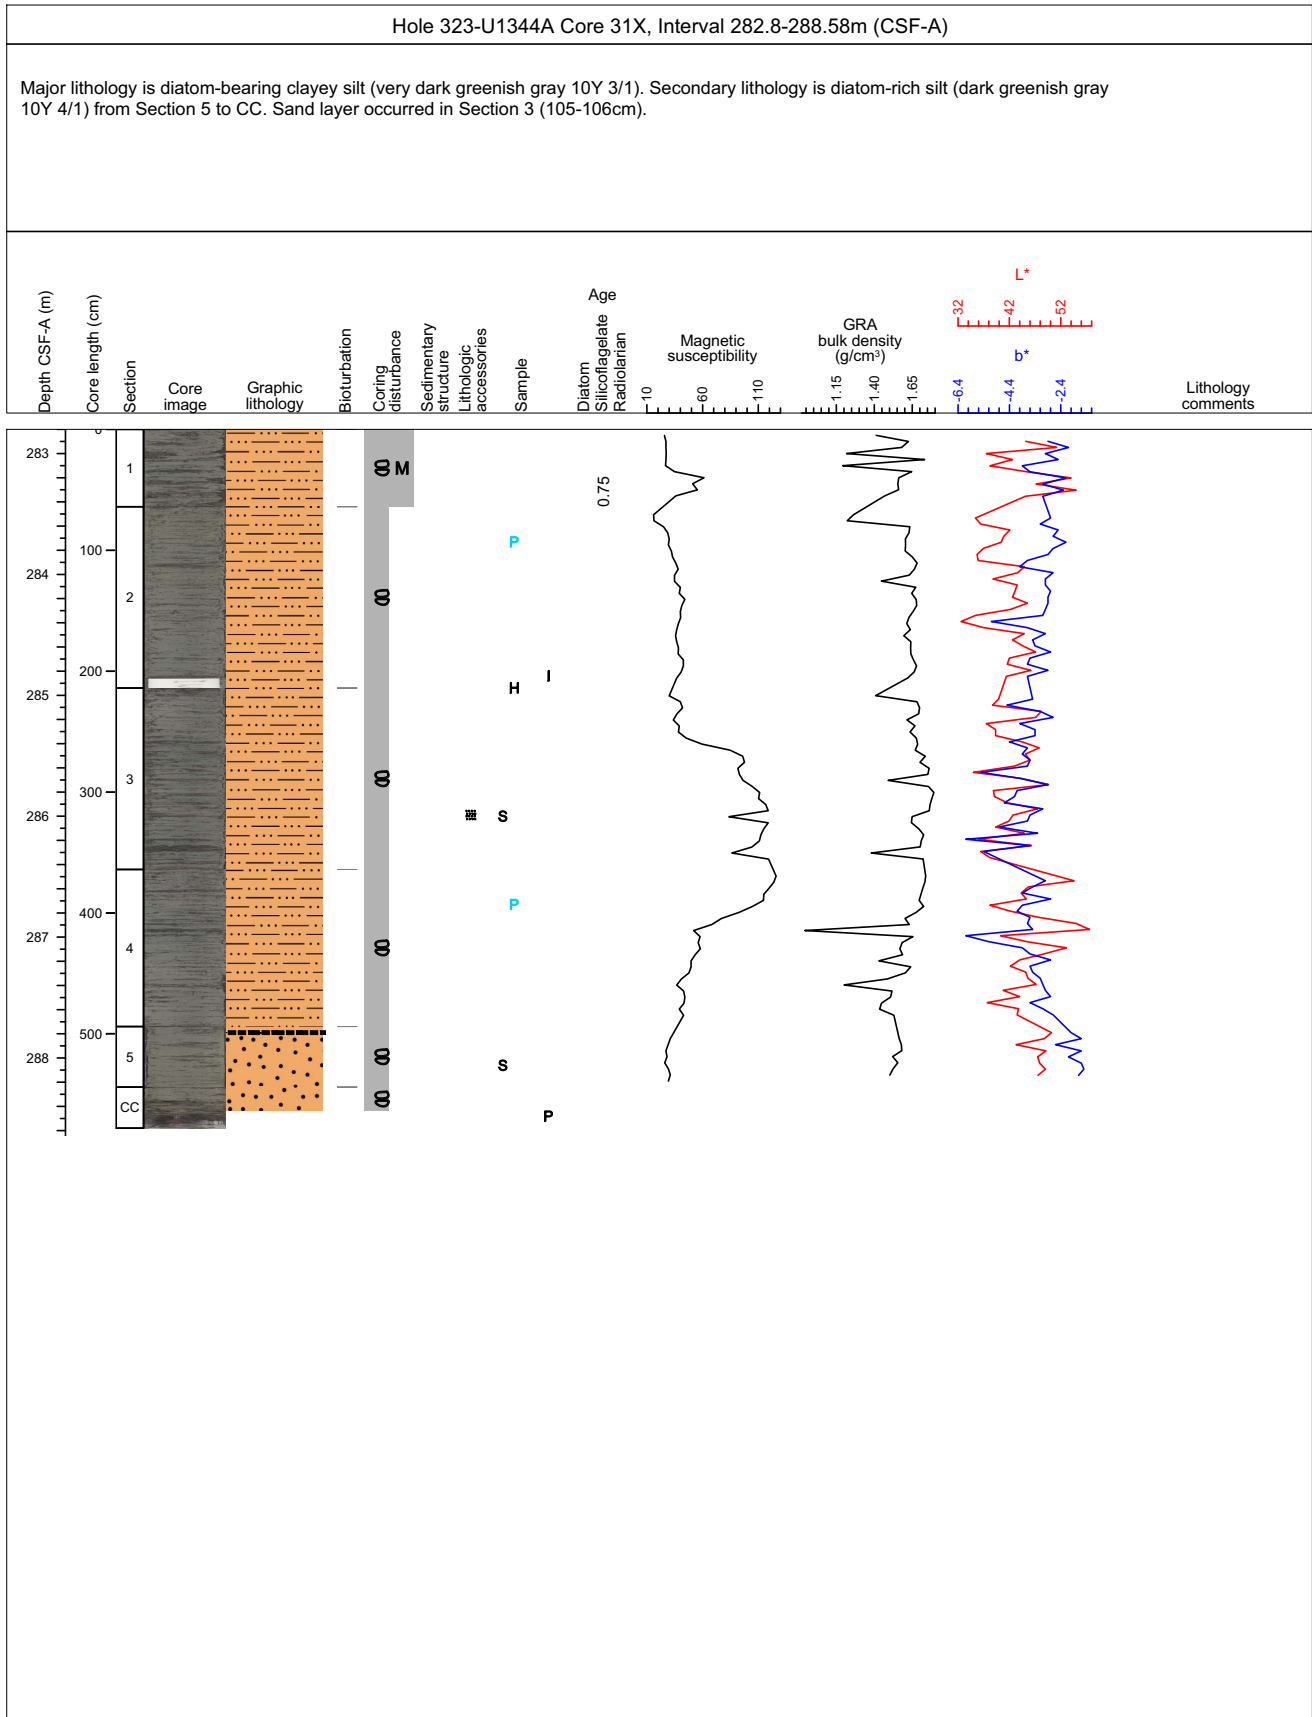

### Core Photo

Hole 323-U1344A Core 30X, Interval 273.2-280.31m (CSF-A)

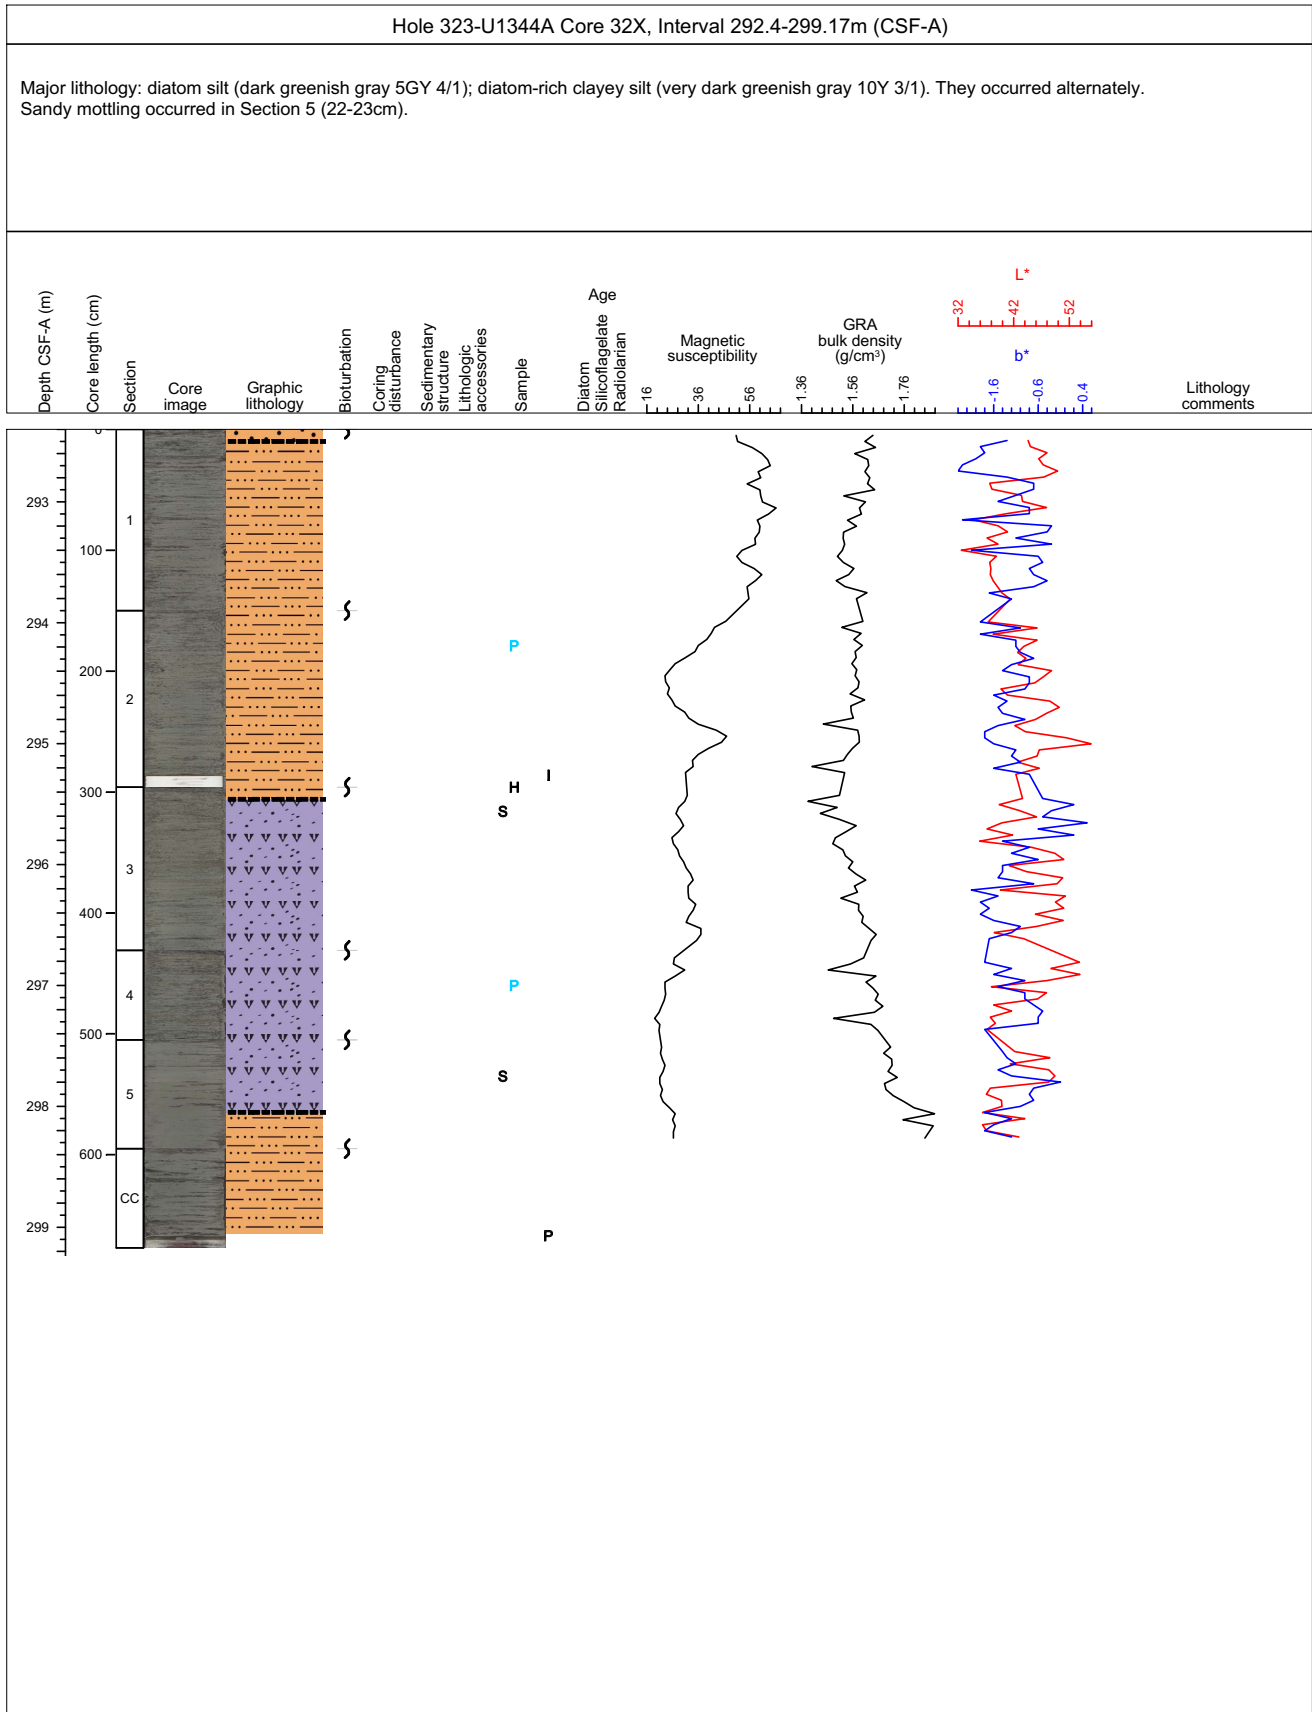

Main lithology is a dark olive grey diatom-rich clayey silt. There are many sponge spicule aggregates. Bioturbation is slight. Section 1 was extruded on the drill floor, so possibly not stratigraphically intact. There is moderate biscuiting throughout the entire core.

### Core Photo

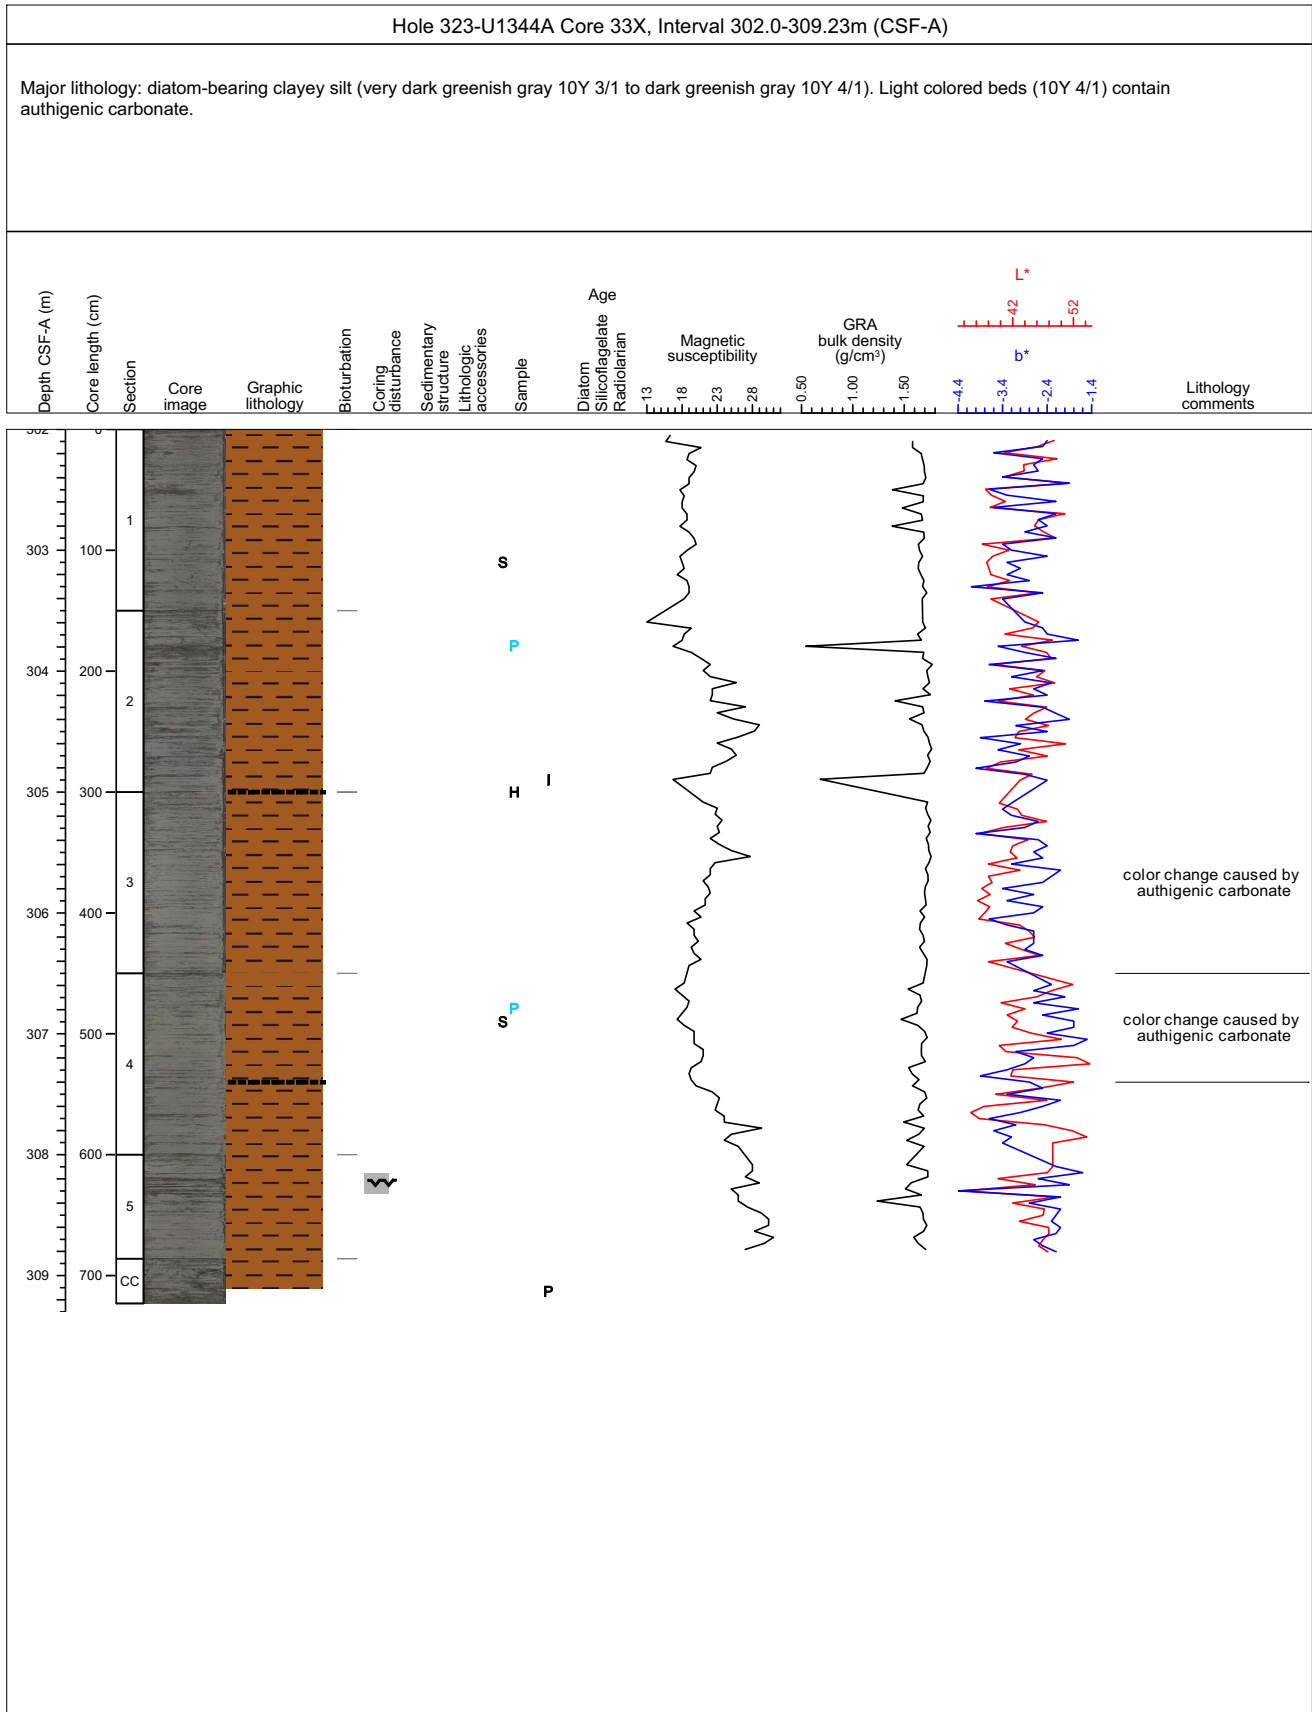

### Core Photo

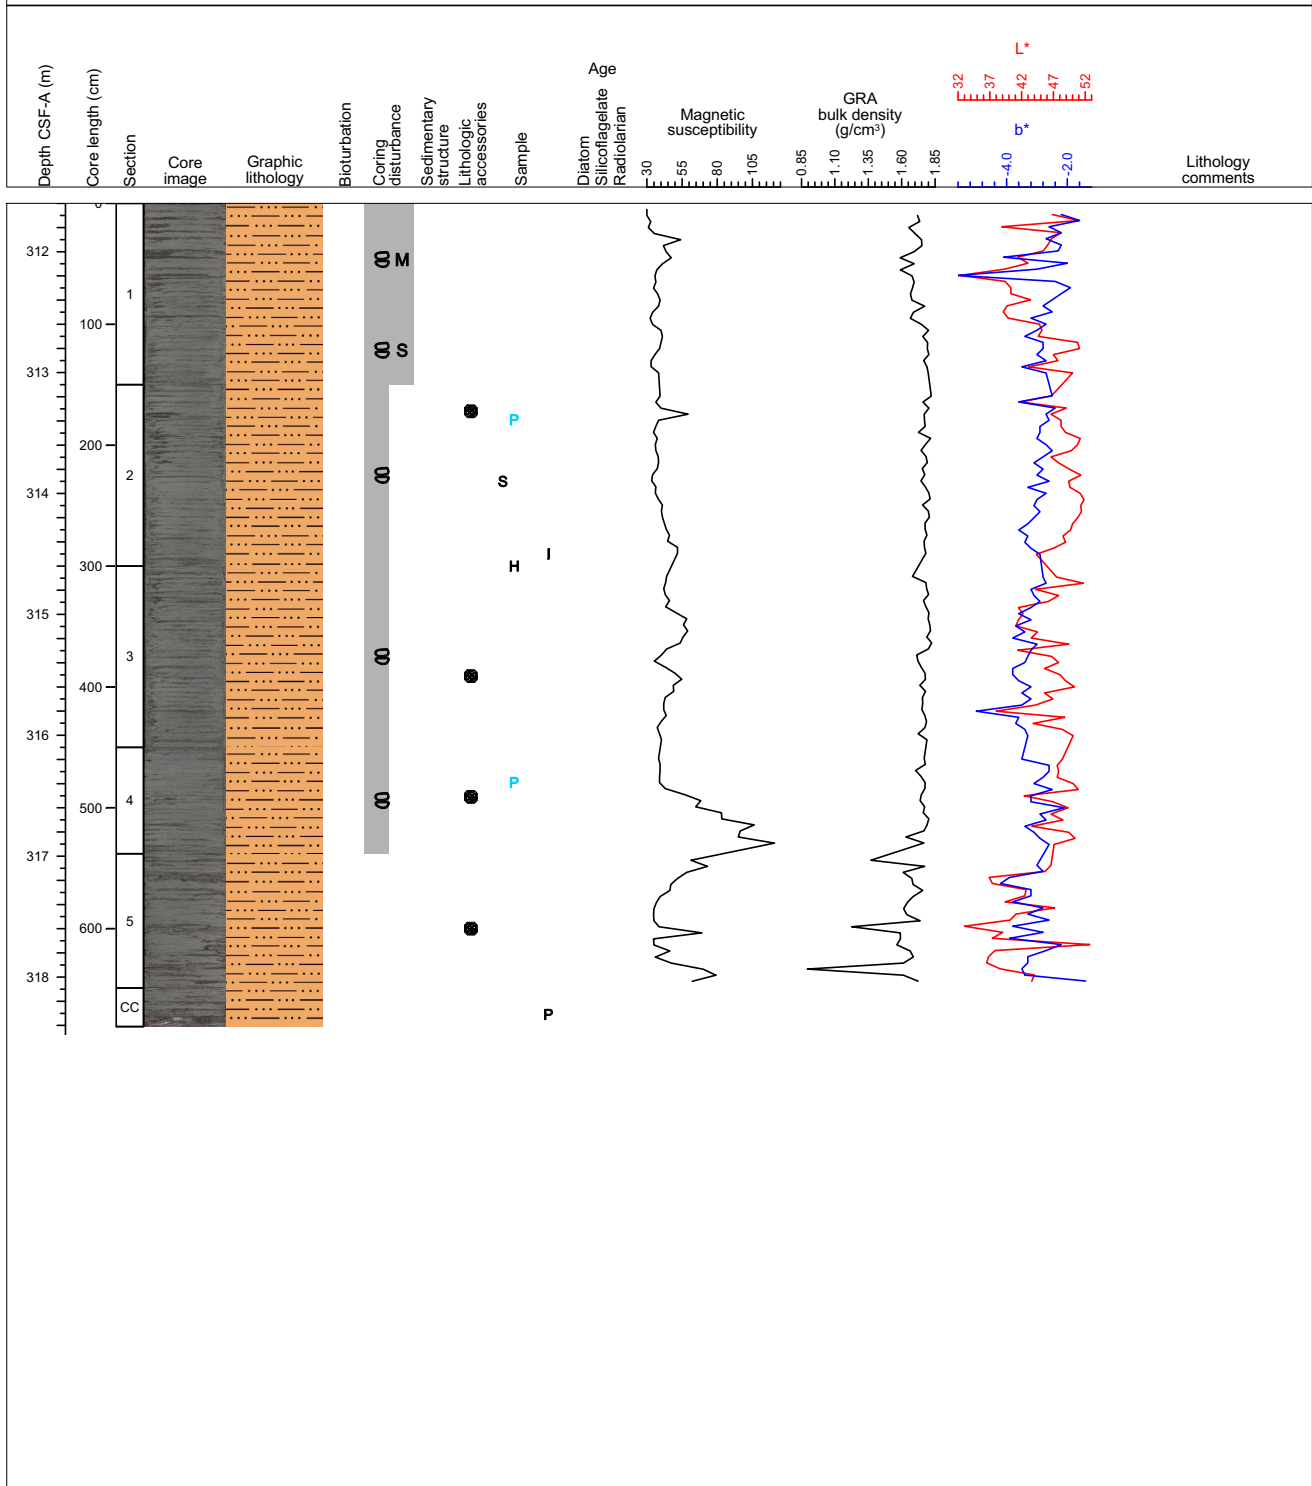

### Core Photo

### Core Photo

Hole 323-U1344A Core 34X, Interval 311.6-318.41m (CSF-A)

Major lithology: very dark greenish gray diatom-rich clayey silt. Several pebbles and granules were found in sections 2-5. Mottles consist of either sand or pyrite streaks and are also present throughout. Drilling disturbance is slight to high and due to biscuiting and gas expansion. Section 5 was extruded onto the rig floor.

## Core Photo

## Core Photo

Hole 323-U1344A Core 36X, Interval 330.4-338.89m (CSF-A)

The main lithologies are very dark gray silty clay (from sections 1 throughout 5) and very dark greenish gray diatom-bearing silty clay (sections 6 to CC). The two lithologies transition gradually. Two lighter colored, acicular authigenic carbonate rich layers occur in sections 5 and 6. The core shows drilling biscuits throughout.

### Core Photo

Hole 323-U1344A Core 37X, Interval 340.0-346.38m (CSF-A)

Major lithology is diatom-bearing clayey silt (very dark gray 3/N). A sandy layer occurred in Section 4 (32-53cm). An authigenic carbonate-rich bed occurred in Section 4 (32-53cm).

### Core Photo

Hole 323-U1344A Core 38X, Interval 349.6-357.08m (CSF-A)

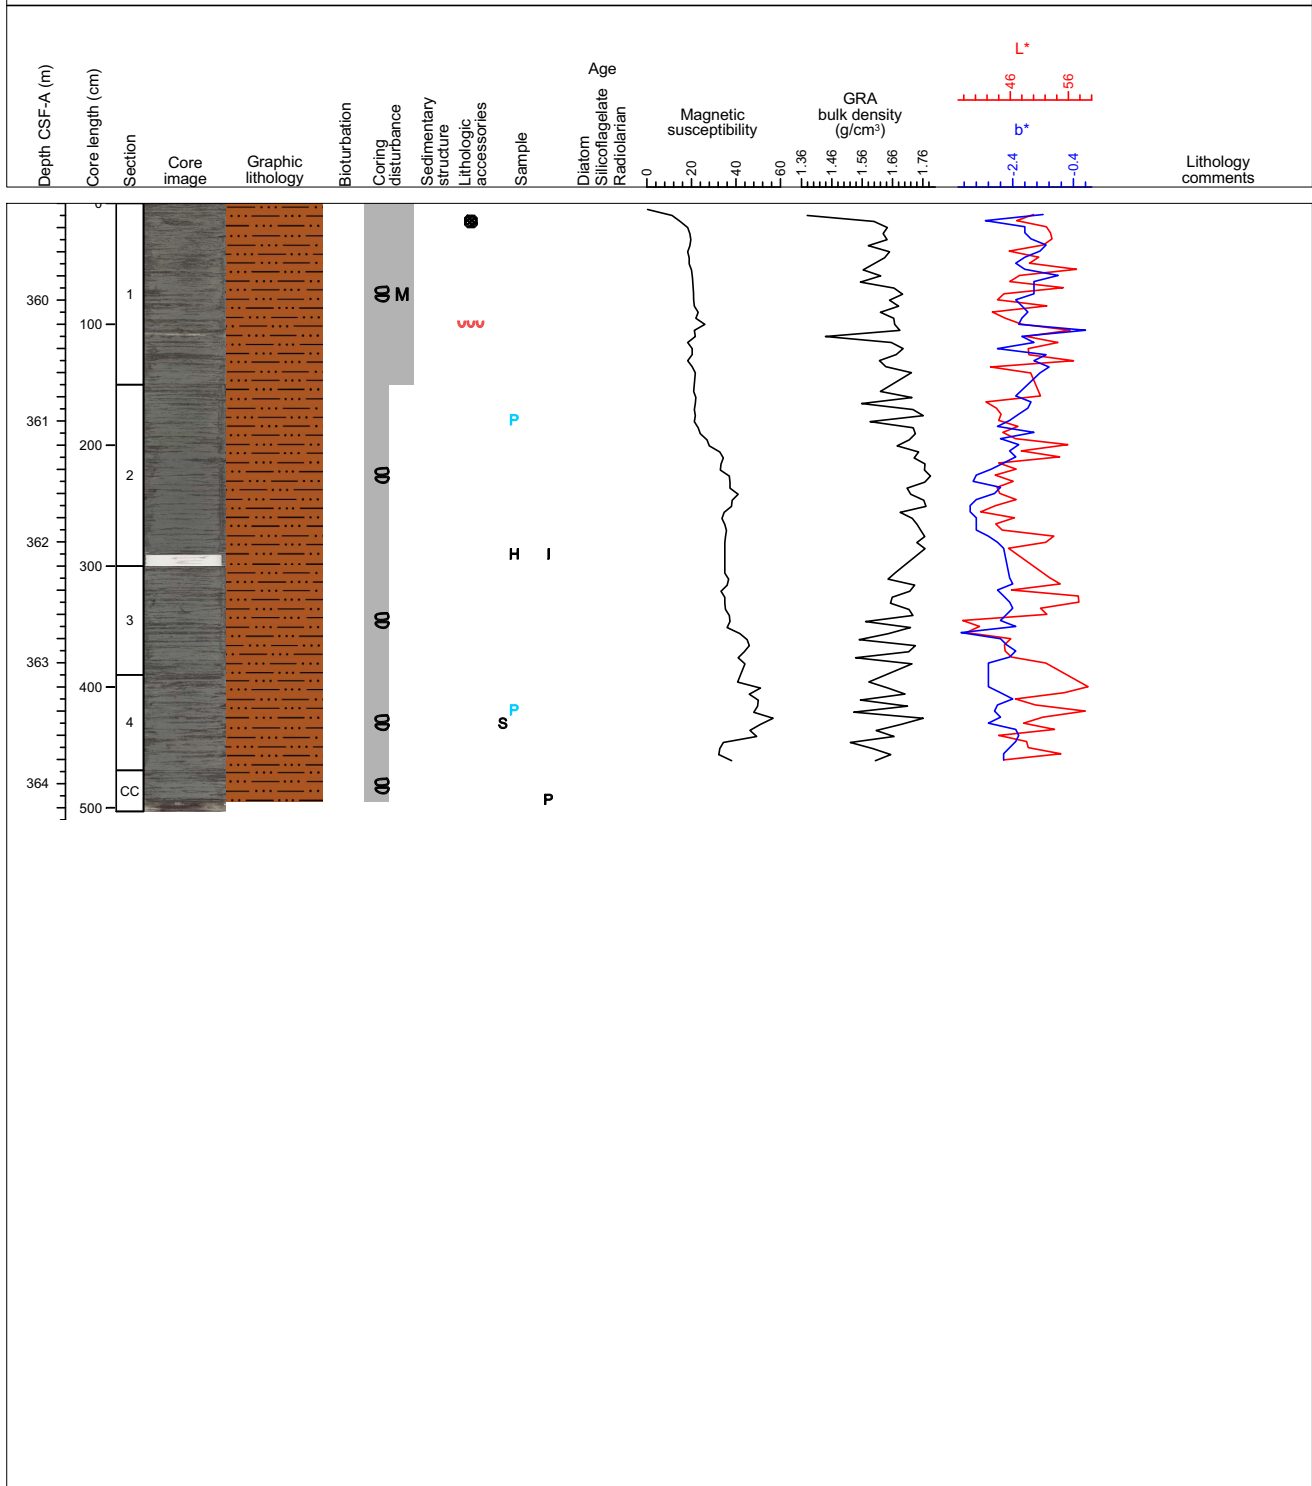

The main lithology is very dark grey silty clay. Bioturbation is not visible. The core shows moderate drilling disturbance (biscuits) throughout.

### Core Photo

Hole 323-U1344A Core 39X, Interval 359.2-364.23m (CSF-A)

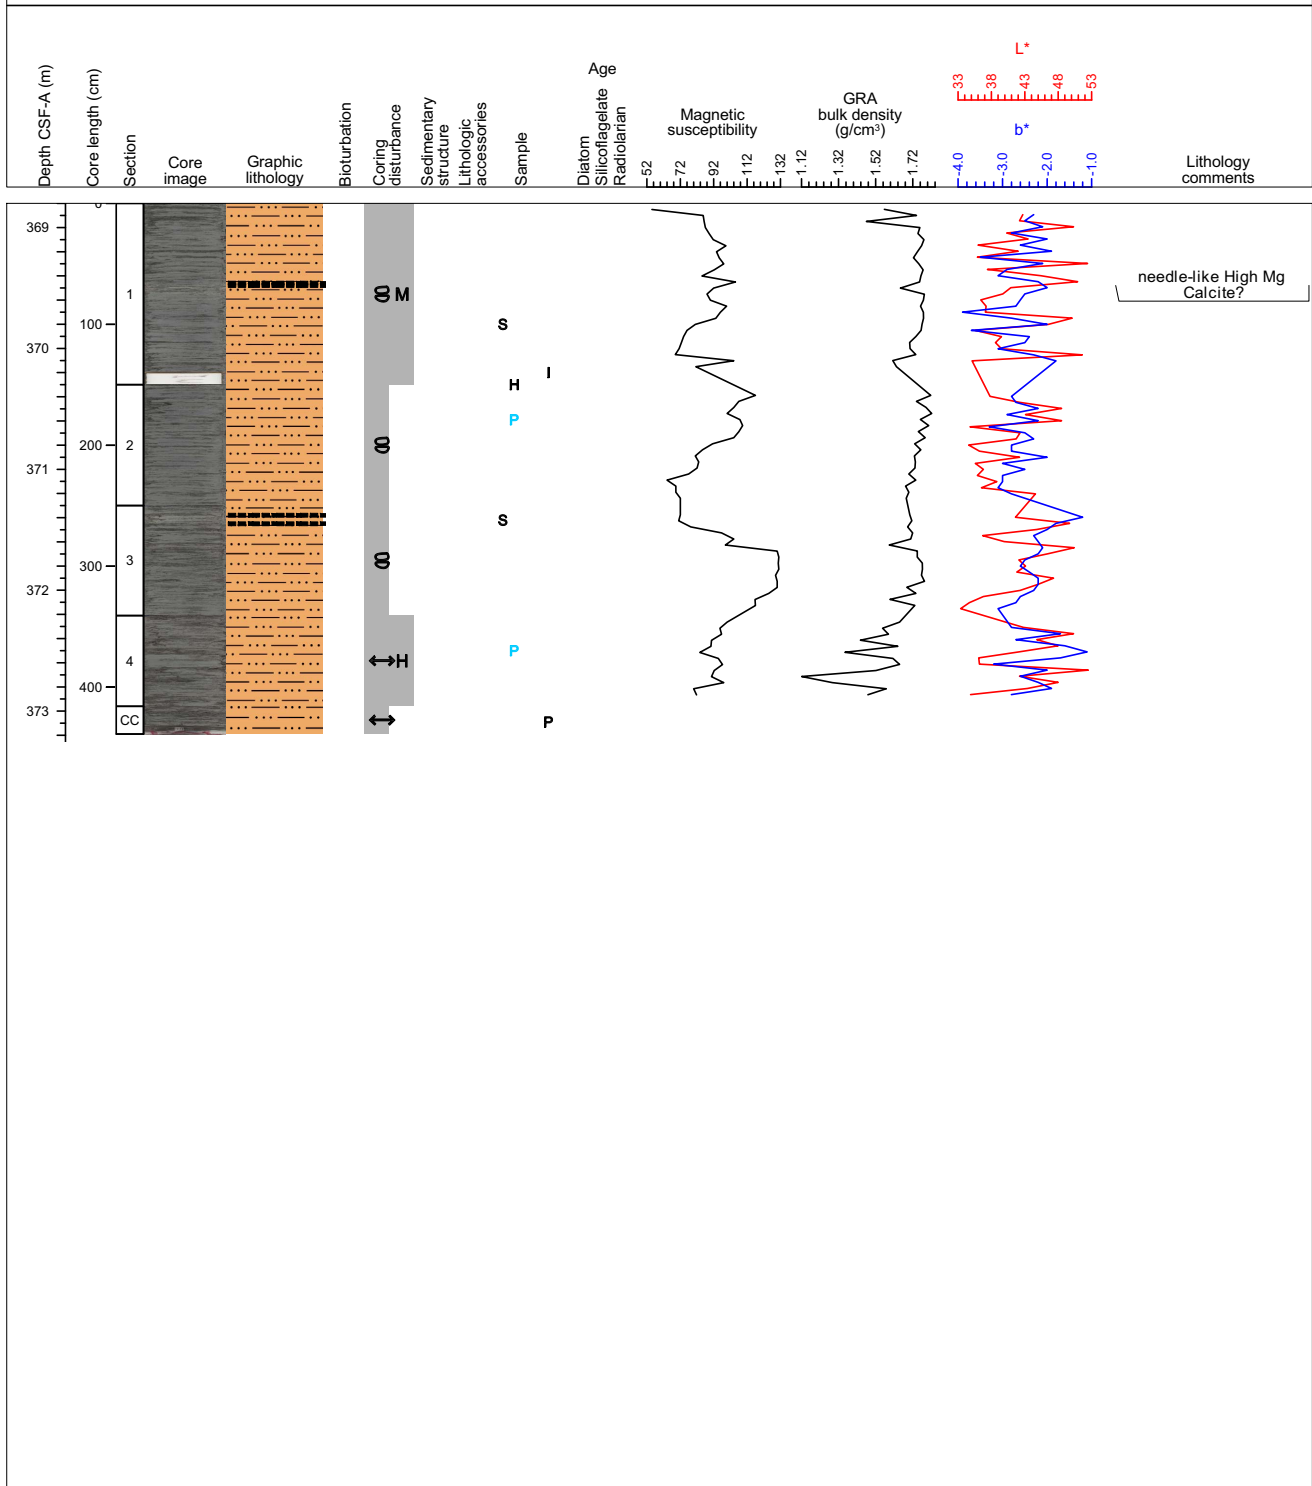

The main lithology is very dark greenish gray diatom-rich silty clay. A large, well rounded pebble (probably basalt) occurs on top of section 1. Two volcanic ash layers occur juxtaposed in section 1, a black one occurs between 100 and 104 cm and a white one between 104 and 106. The core shows drilling disturbance (biscuits) throughout.

### Core Photo

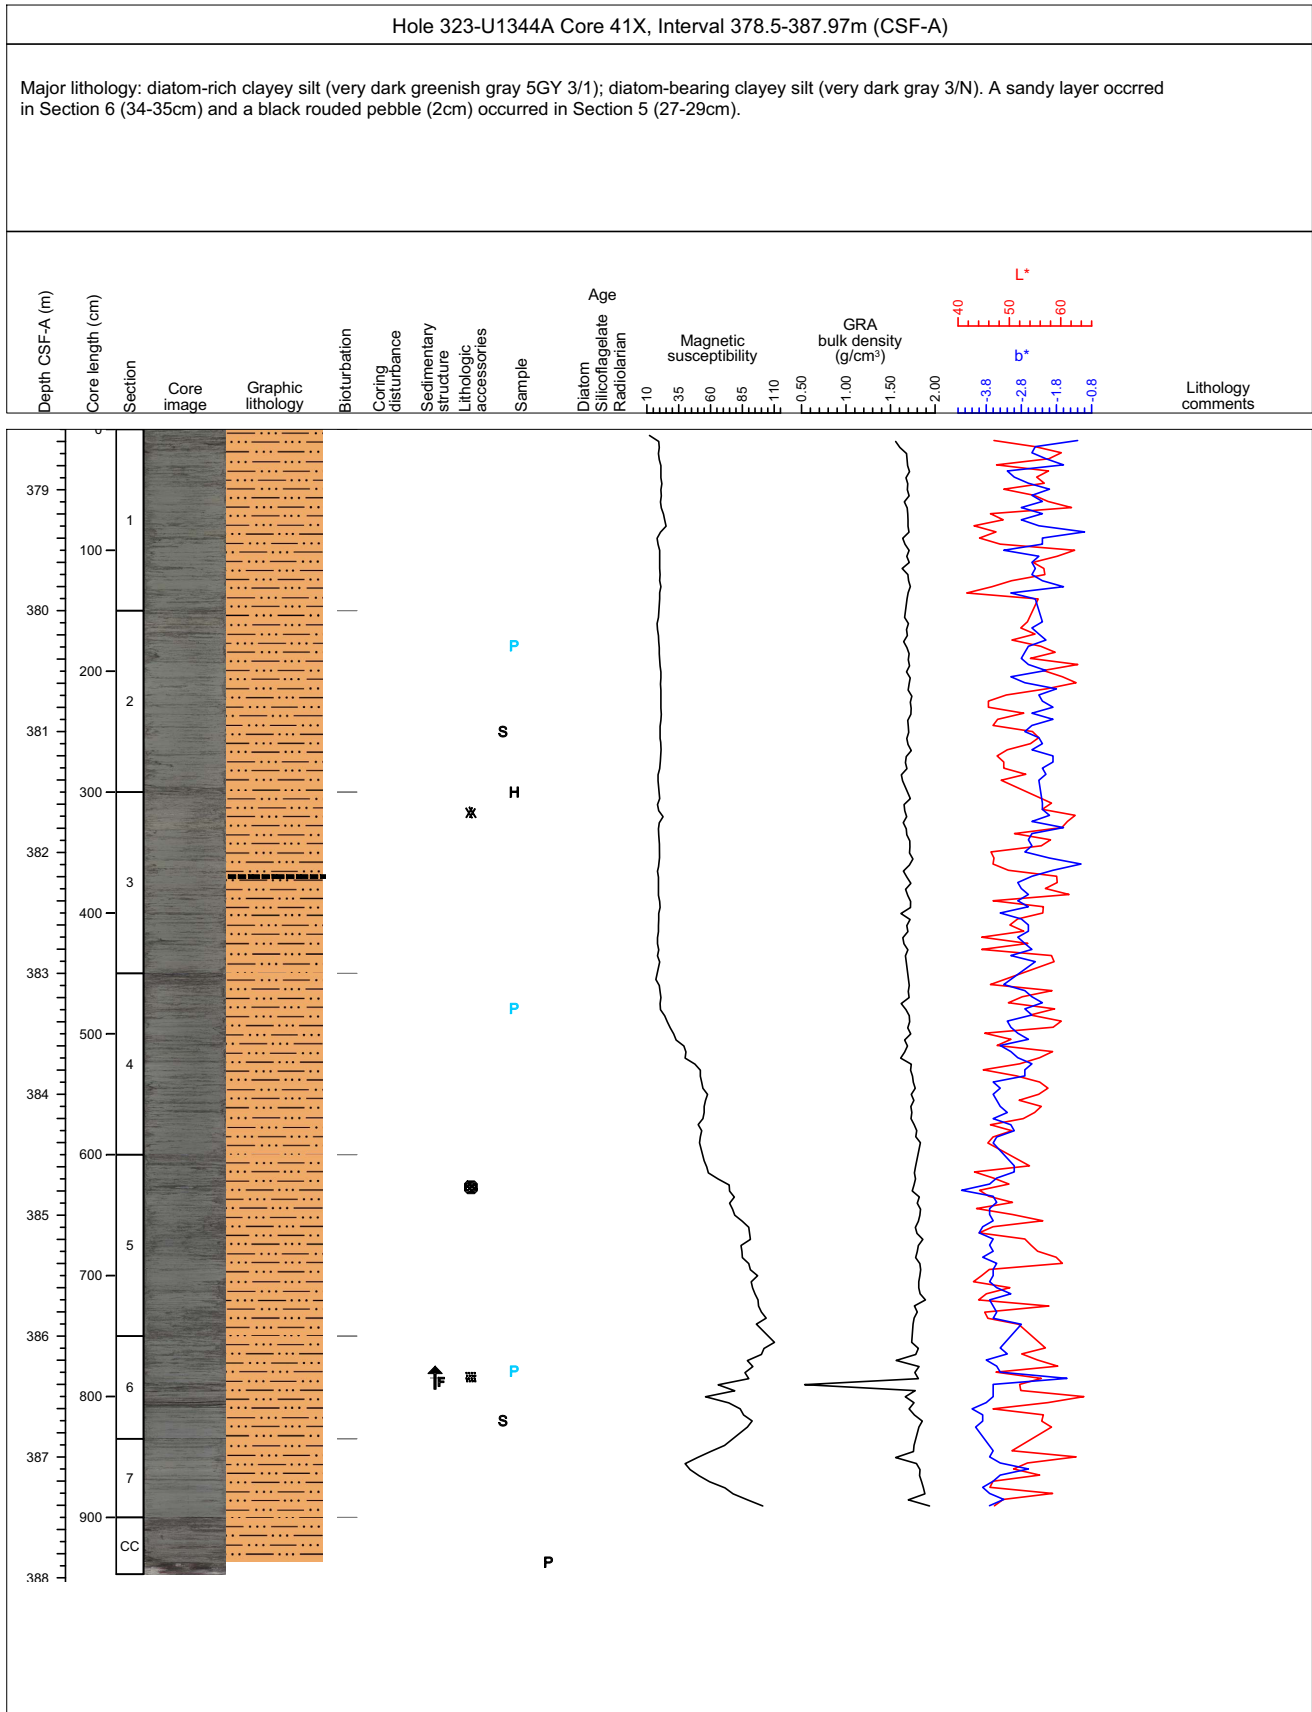

Hole 323-U1344A Core 40X, Interval 368.8-373.19m (CSF-A)

Major lithology: black diatom-bearing clayey silt. Secondary lithology: dark greenish gray authigenic carbonate- and diatom-rich clayey silt. The two lighter, authigenic carbonate-rich intervals occur in sections 1 and 3. Pyrite streaks and mottles are seen throughout. Drilling disturbance is moderate to severe due to biscuiting and gas expansion.

### Core Photo

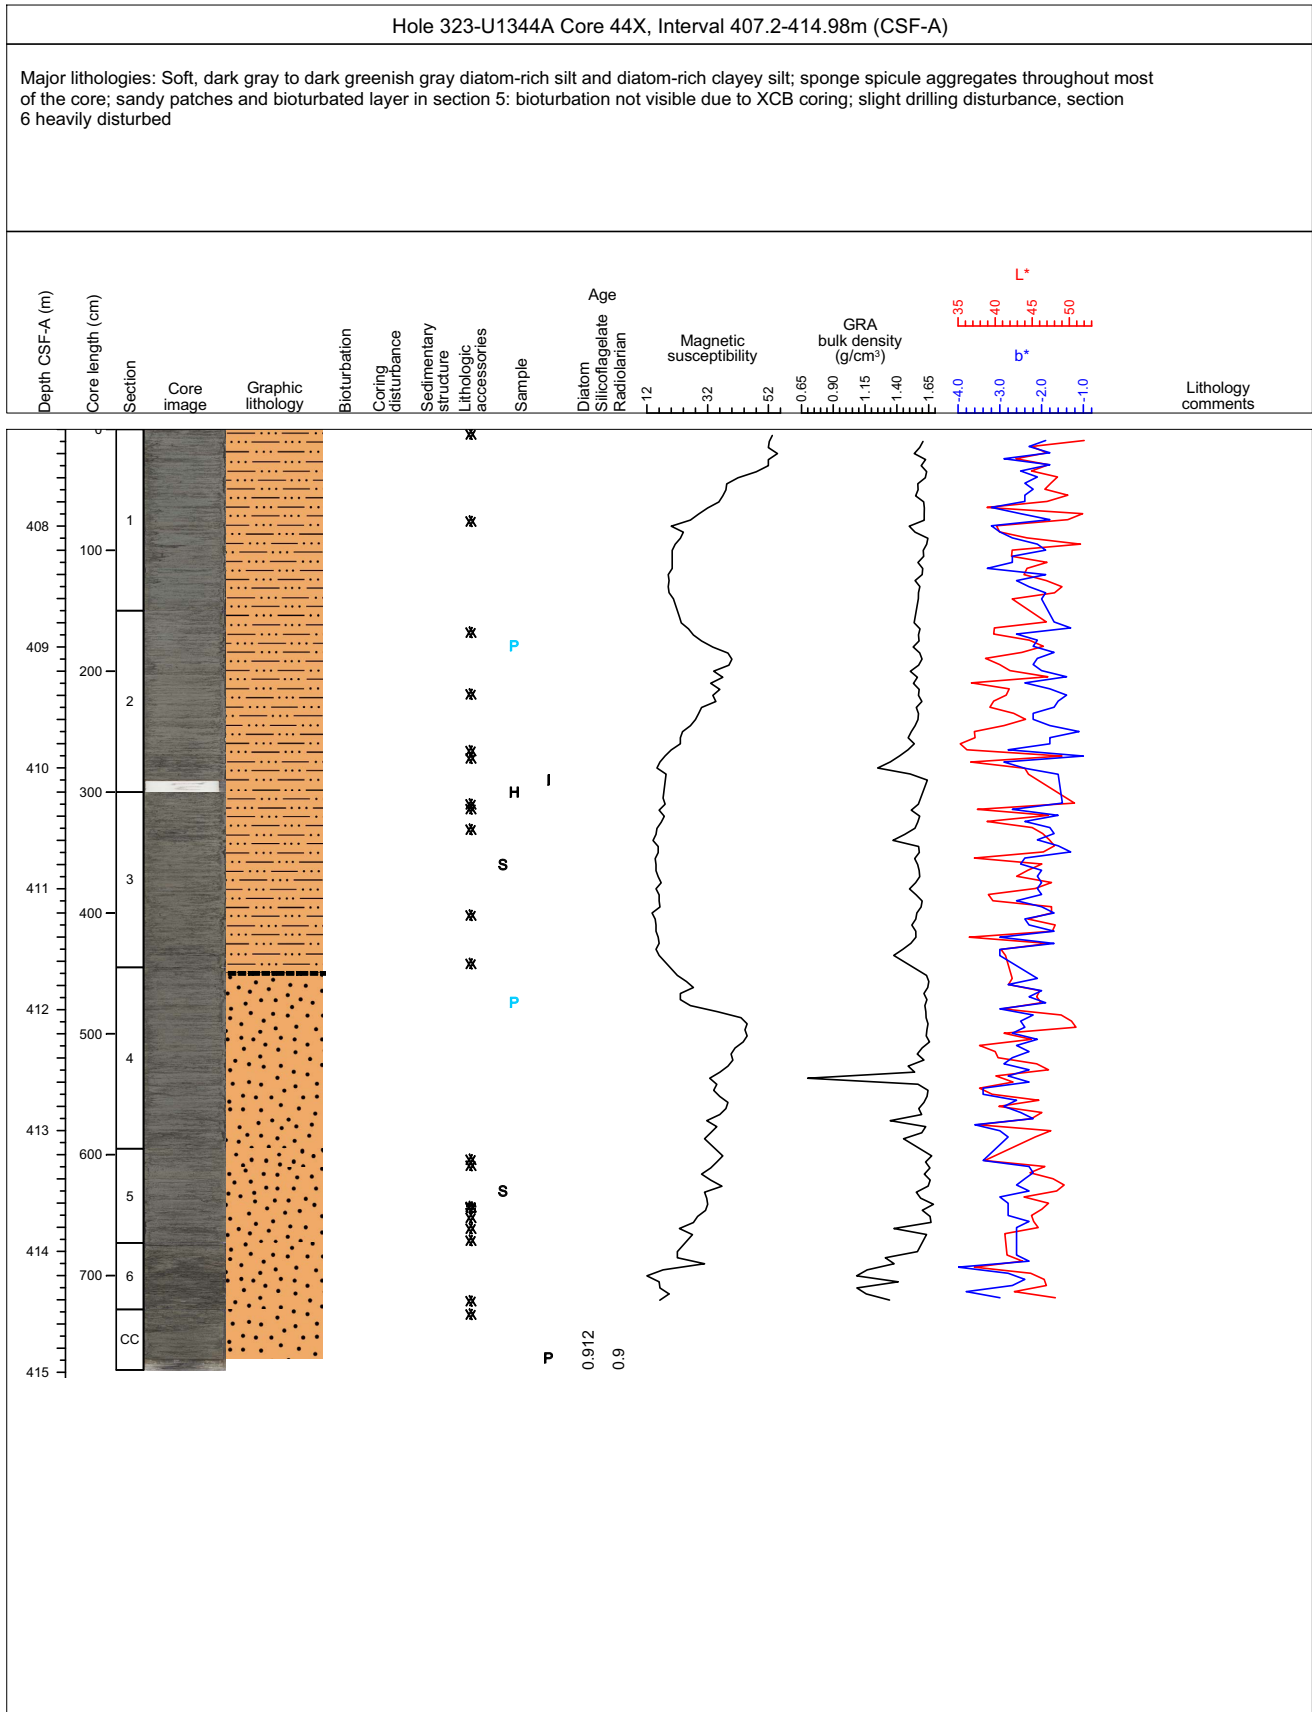

### Core Photo

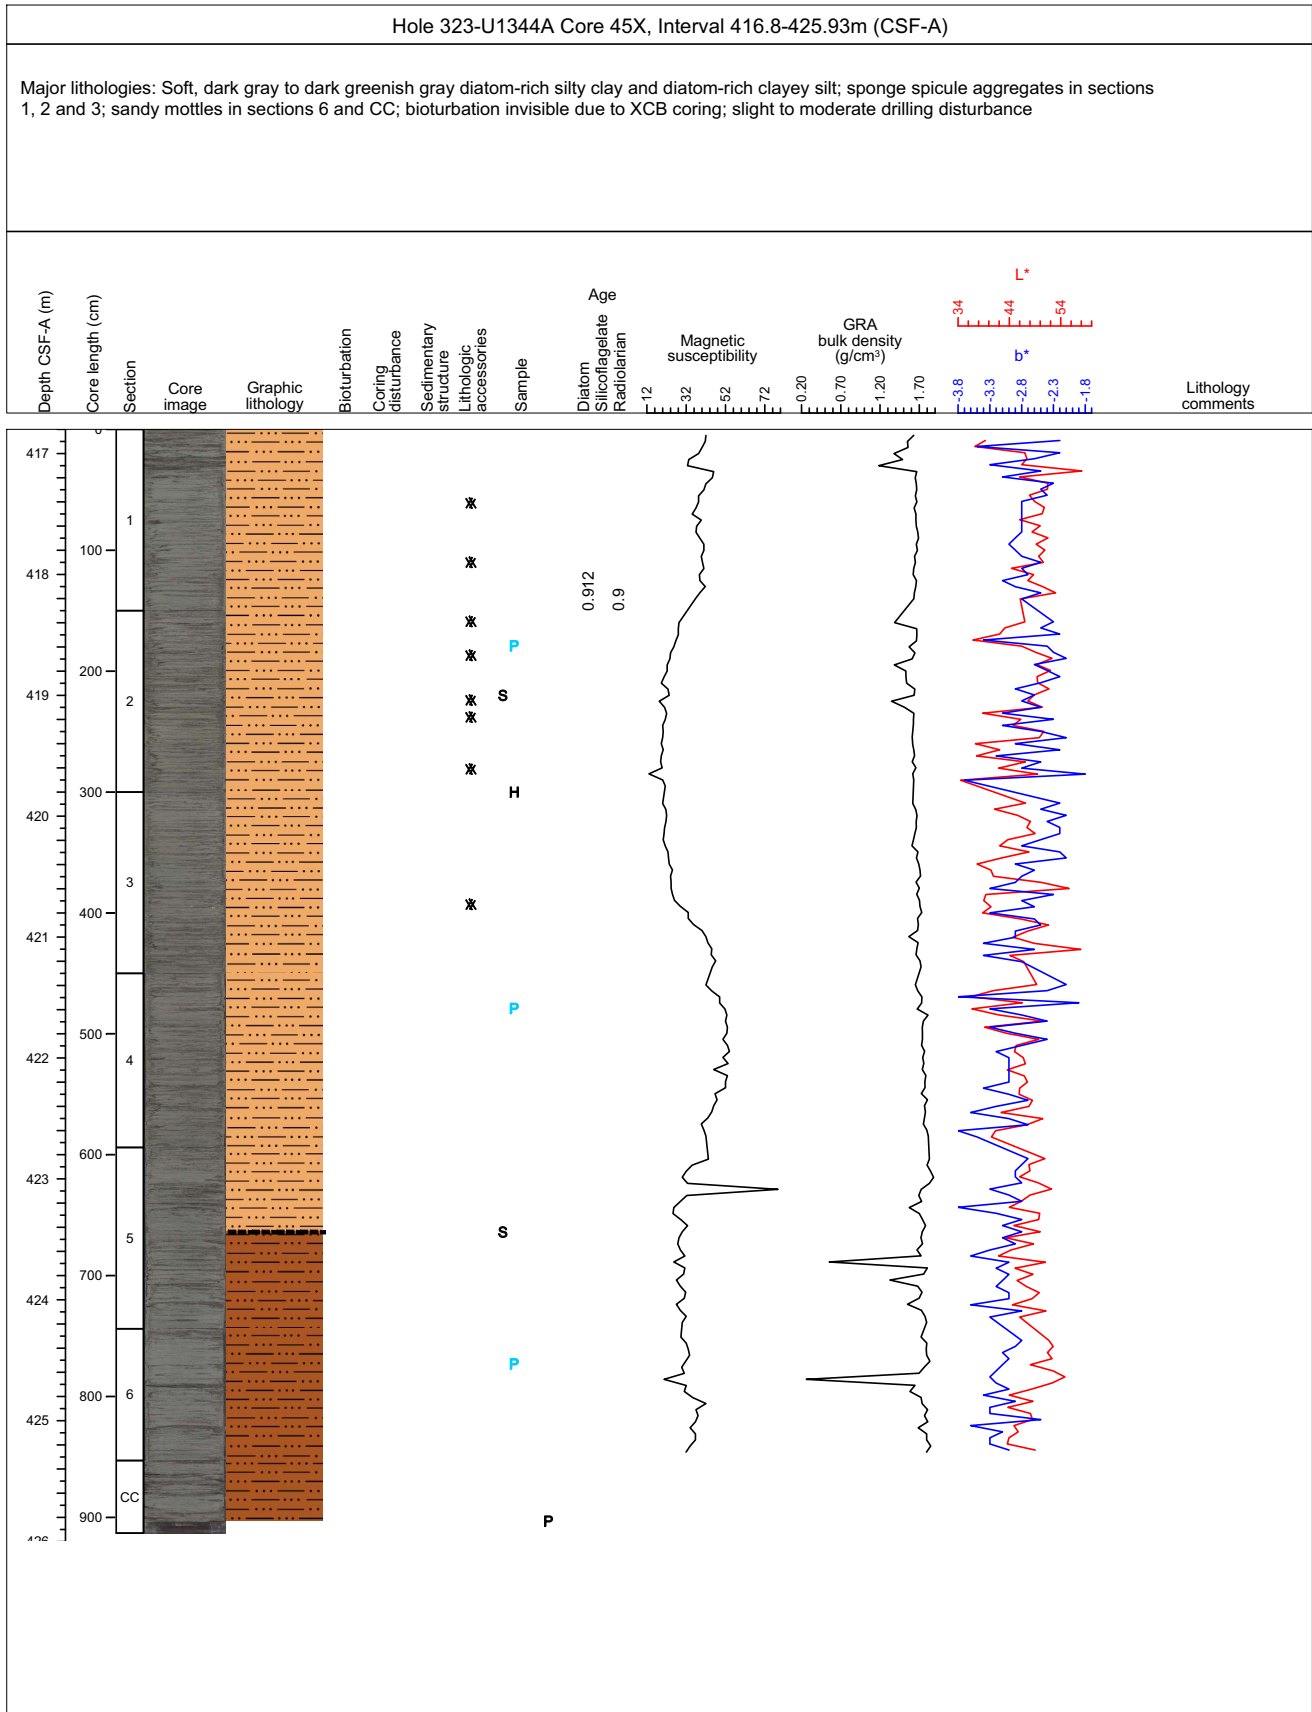

### Core Photo

### Core Photo

### Core Photo

### Core Photo

Hole 323-U1344A Core 46X, Interval 426.4-434.1m (CSF-A)

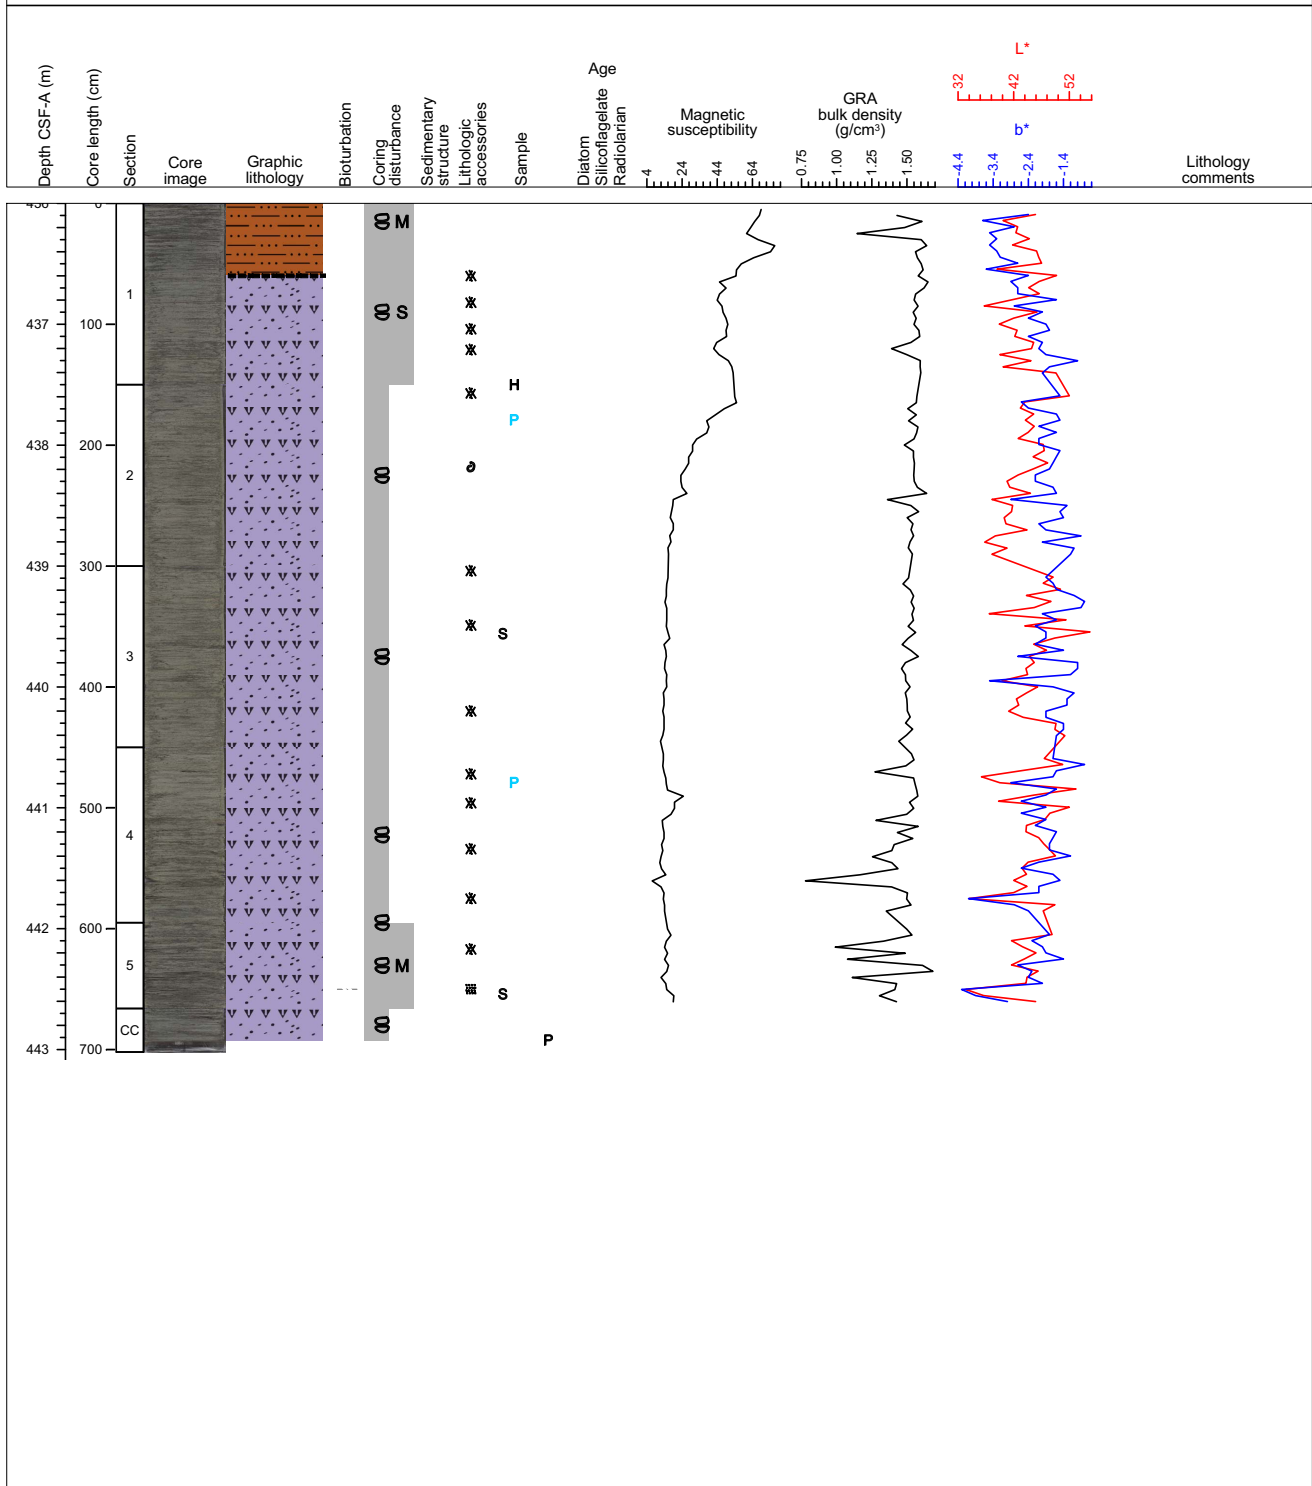

Main lithology is greenish black diatom-rich silty clay. There are sponge spicule aggregates and small sandy mottles throughout the core. Bioturbation is absent. Drilling disturbance varies from slight to severe.

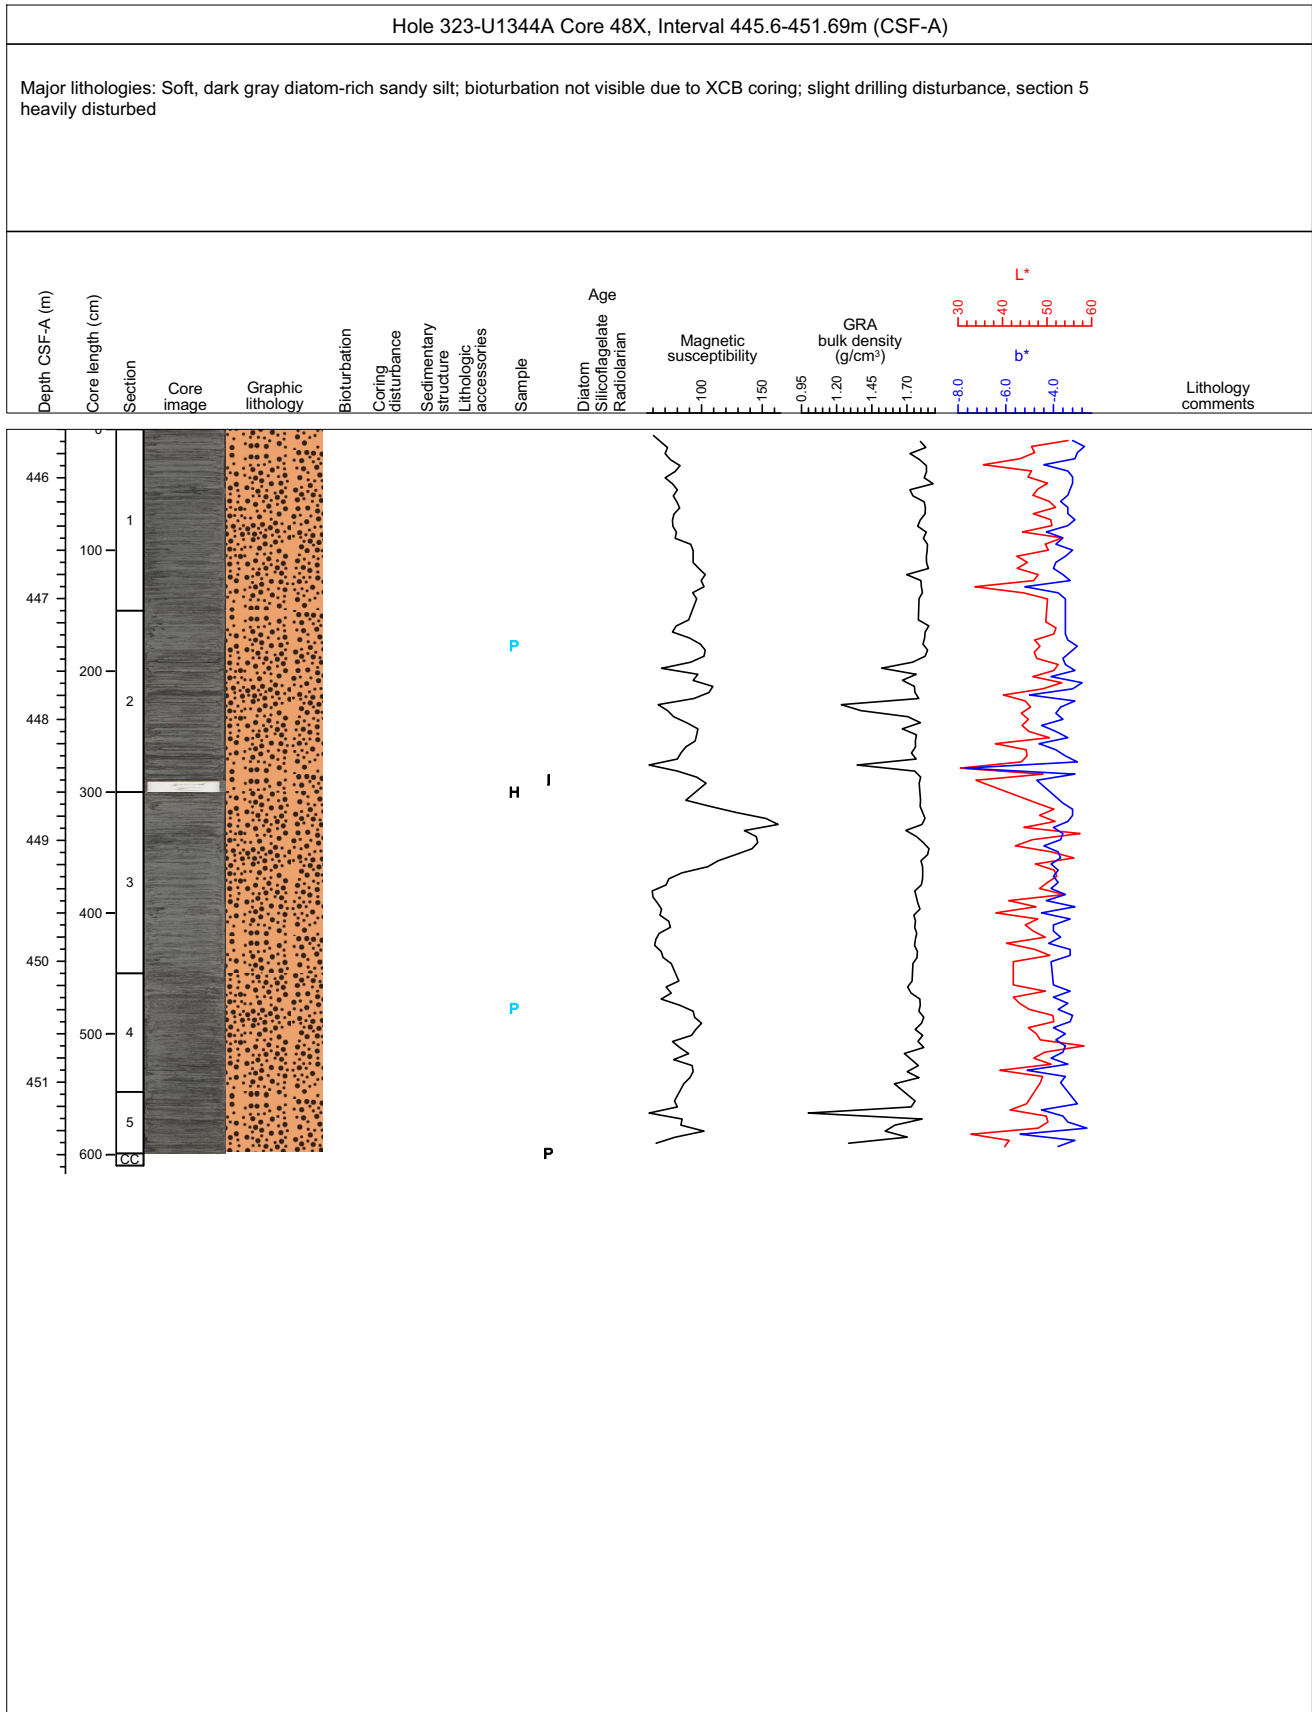

### Core Photo

Hole 323-U1344A Core 47X, Interval 436.0-443.02m (CSF-A)

The main lithologies are greenish black diatom-rich silty clay and very dark greenish grey diatom ooze. The boundary is gradational. There are sponge spicule aggregates throughout the core and a shell fragment in section 2. Bioturbation is absent. Drilling disturbance varies from slight to moderate.

### Core Photo

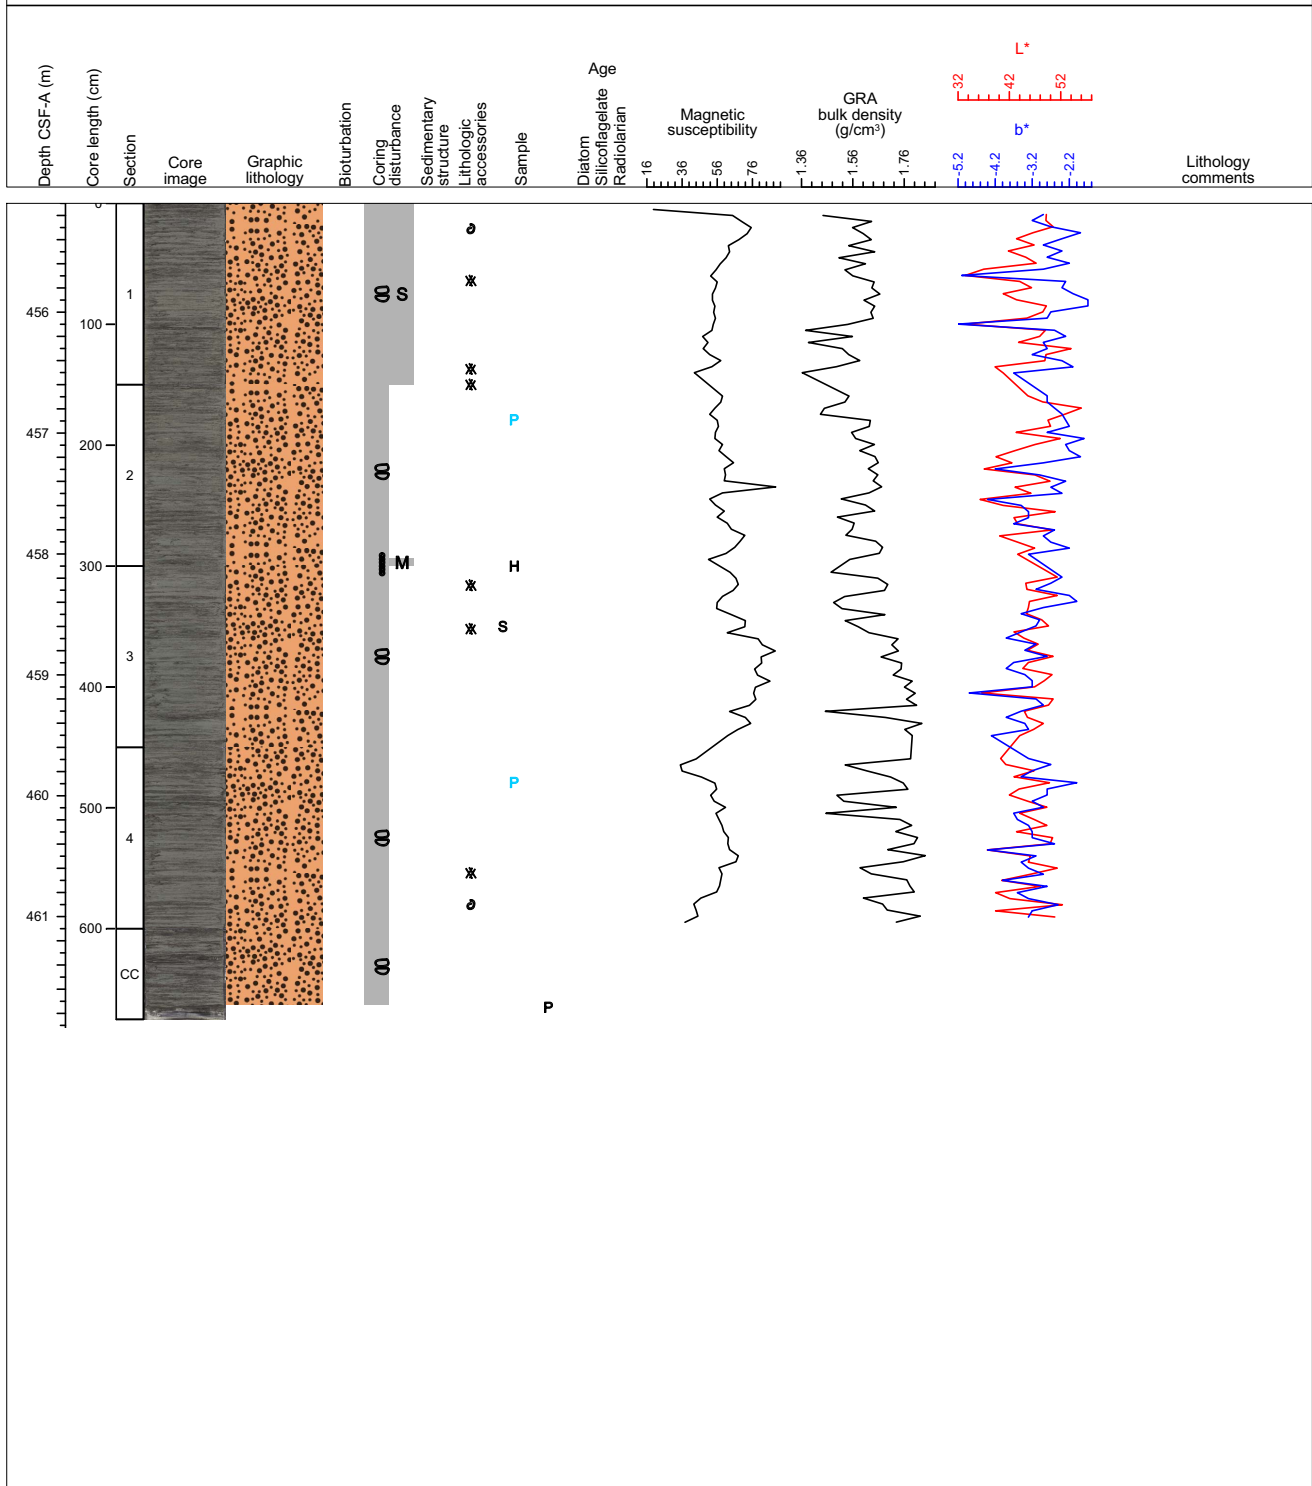

### Core Photo

Hole 323-U1344A Core 49X, Interval 455.1-461.85m (CSF-A)

Main lithology is greenish black diatom-rich sandy silt with small sponge spicule aggregates through sections 1-4. There are shell fragments in sections 1 and 4. Bioturbation is absent. The core is disturbed by biscuiting.

### Core Photo

Hole 323-U1344A Core 50X, Interval 464.7-473.49m (CSF-A)

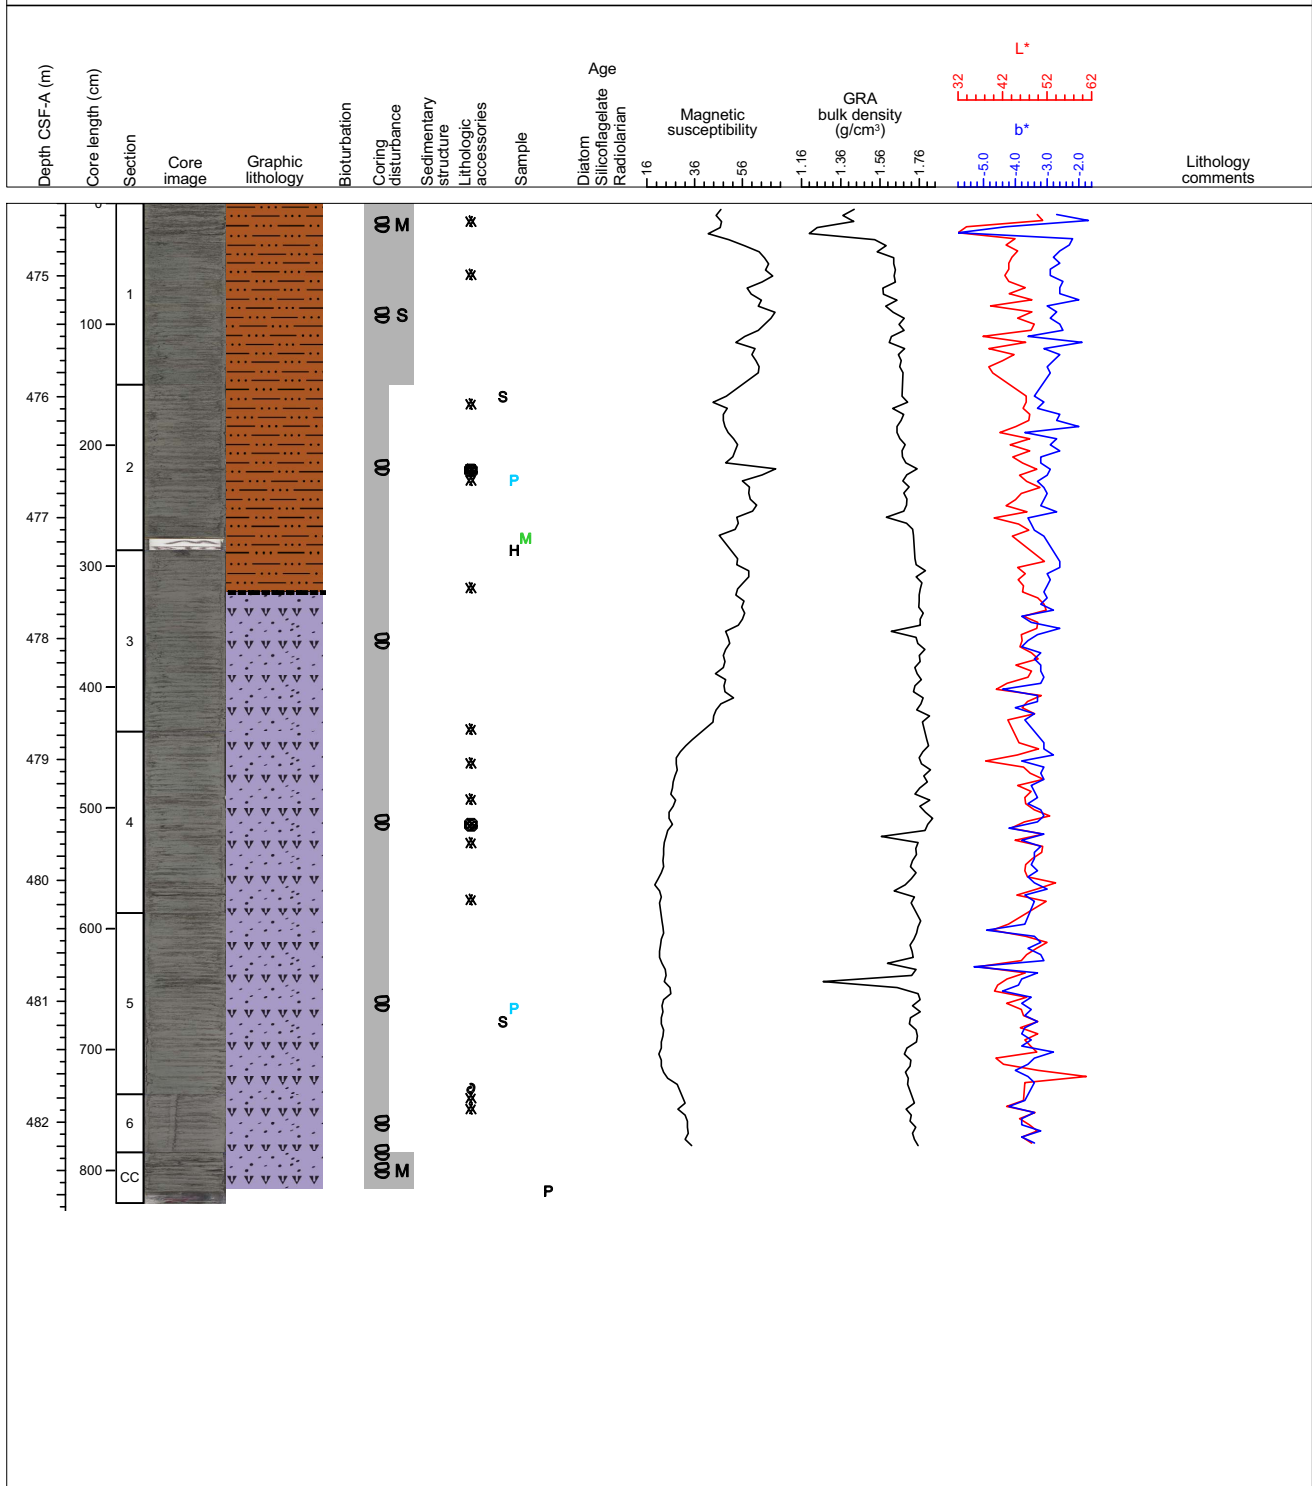

The main lithology is greenish black diatom-bearing silty clay. There are layers of authigenic carbonate-rich diatom-rich sandy clay in sections 2, 4 and 6. Boundaries are gradational. There are sponge spicule aggregates in section 6. Bioturbation is not visible and drilling disturbance is slight except in the core catcher which has moderate disturbance.

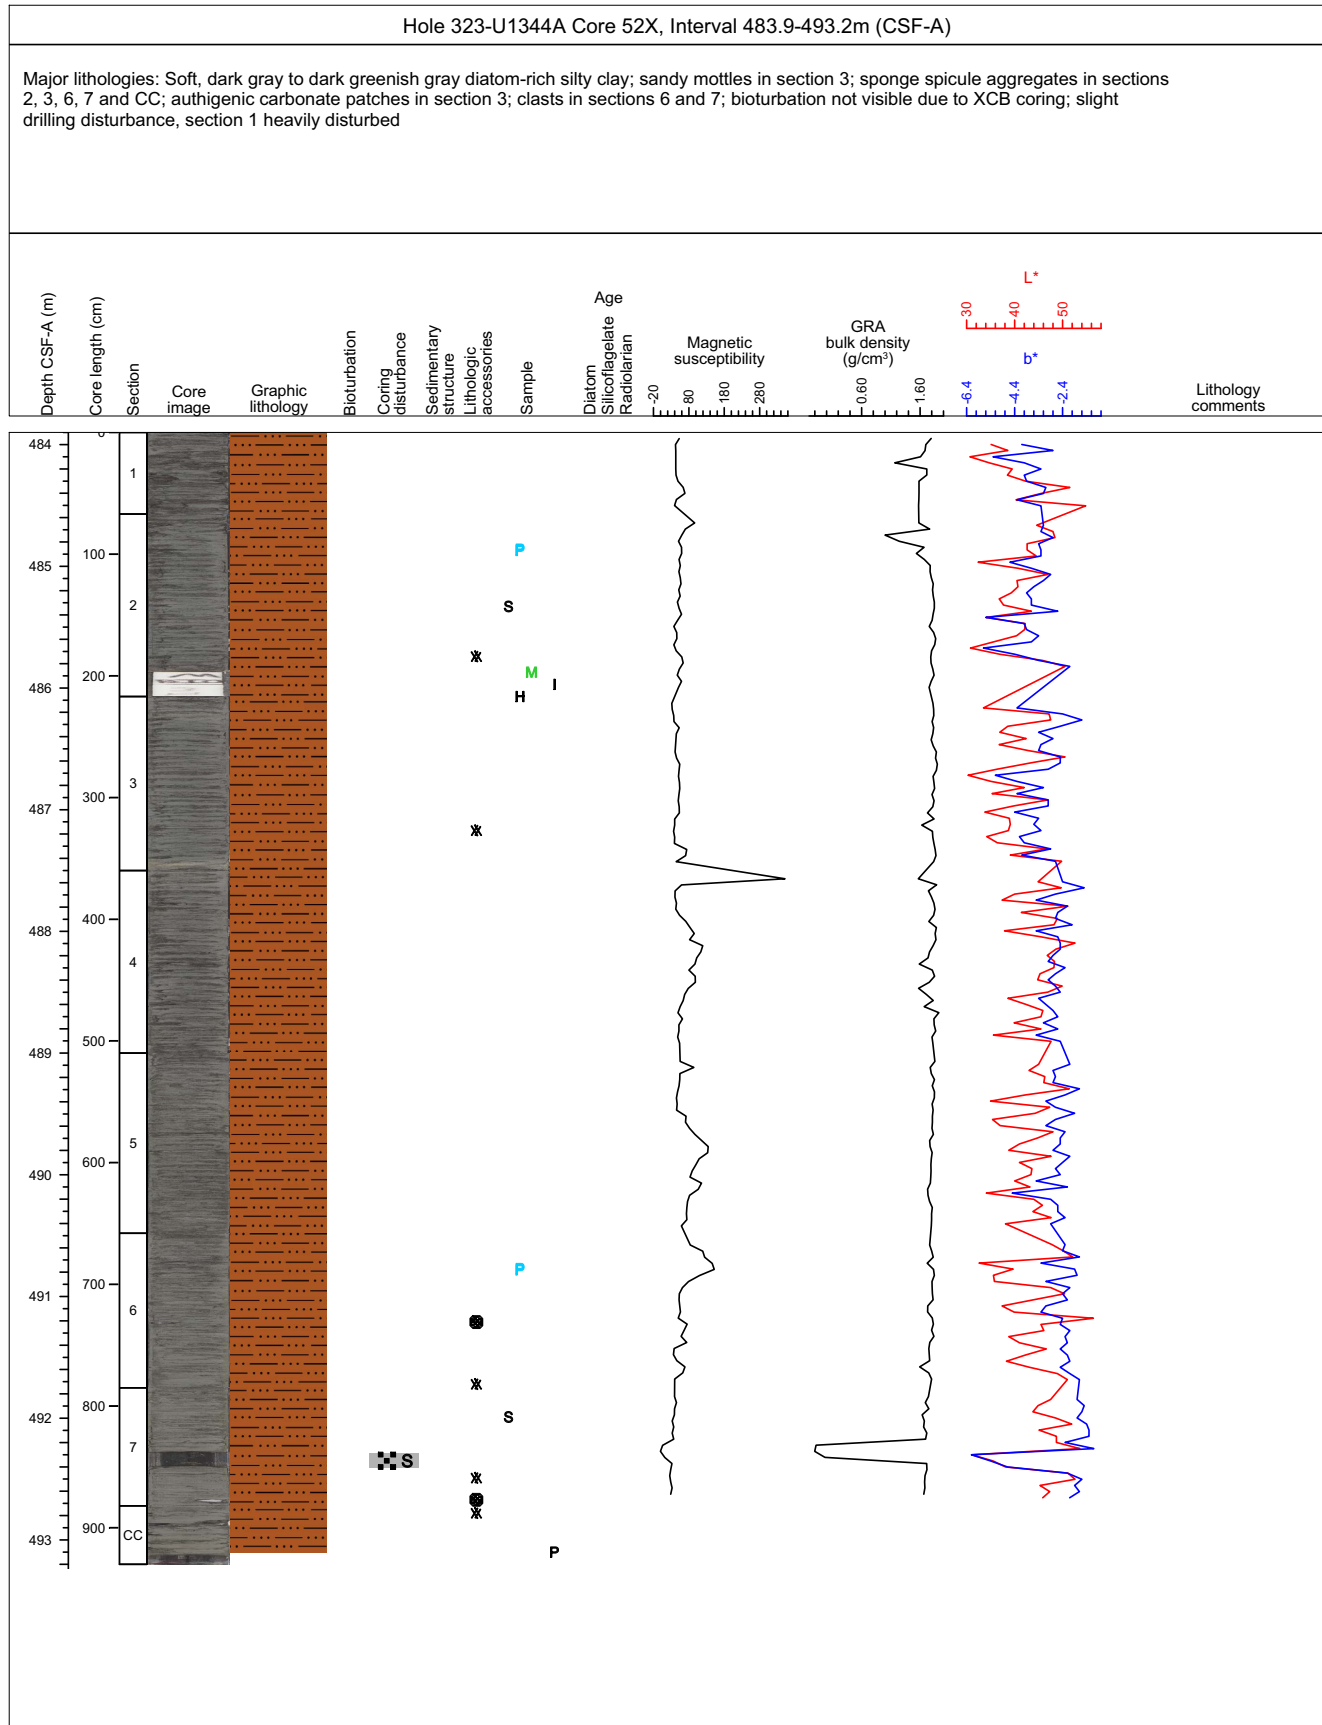

### Core Photo

Hole 323-U1344A Core 51X, Interval 474.4-482.67m (CSF-A)

The main lithologies are very dark grey diatom-rich silty clay and diatom silt. The boundary is gradational. There are sponge spicule aggregates throughout the core, rounded black clasts in sections 2 and 4 and a sandy lamina in section 2. Bioturbation is not visible. Coring disturbance is slight to moderate.

### Core Photo

### Core Photo

Hole 323-U1344A Core 53X, Interval 493.2-502.13m (CSF-A)

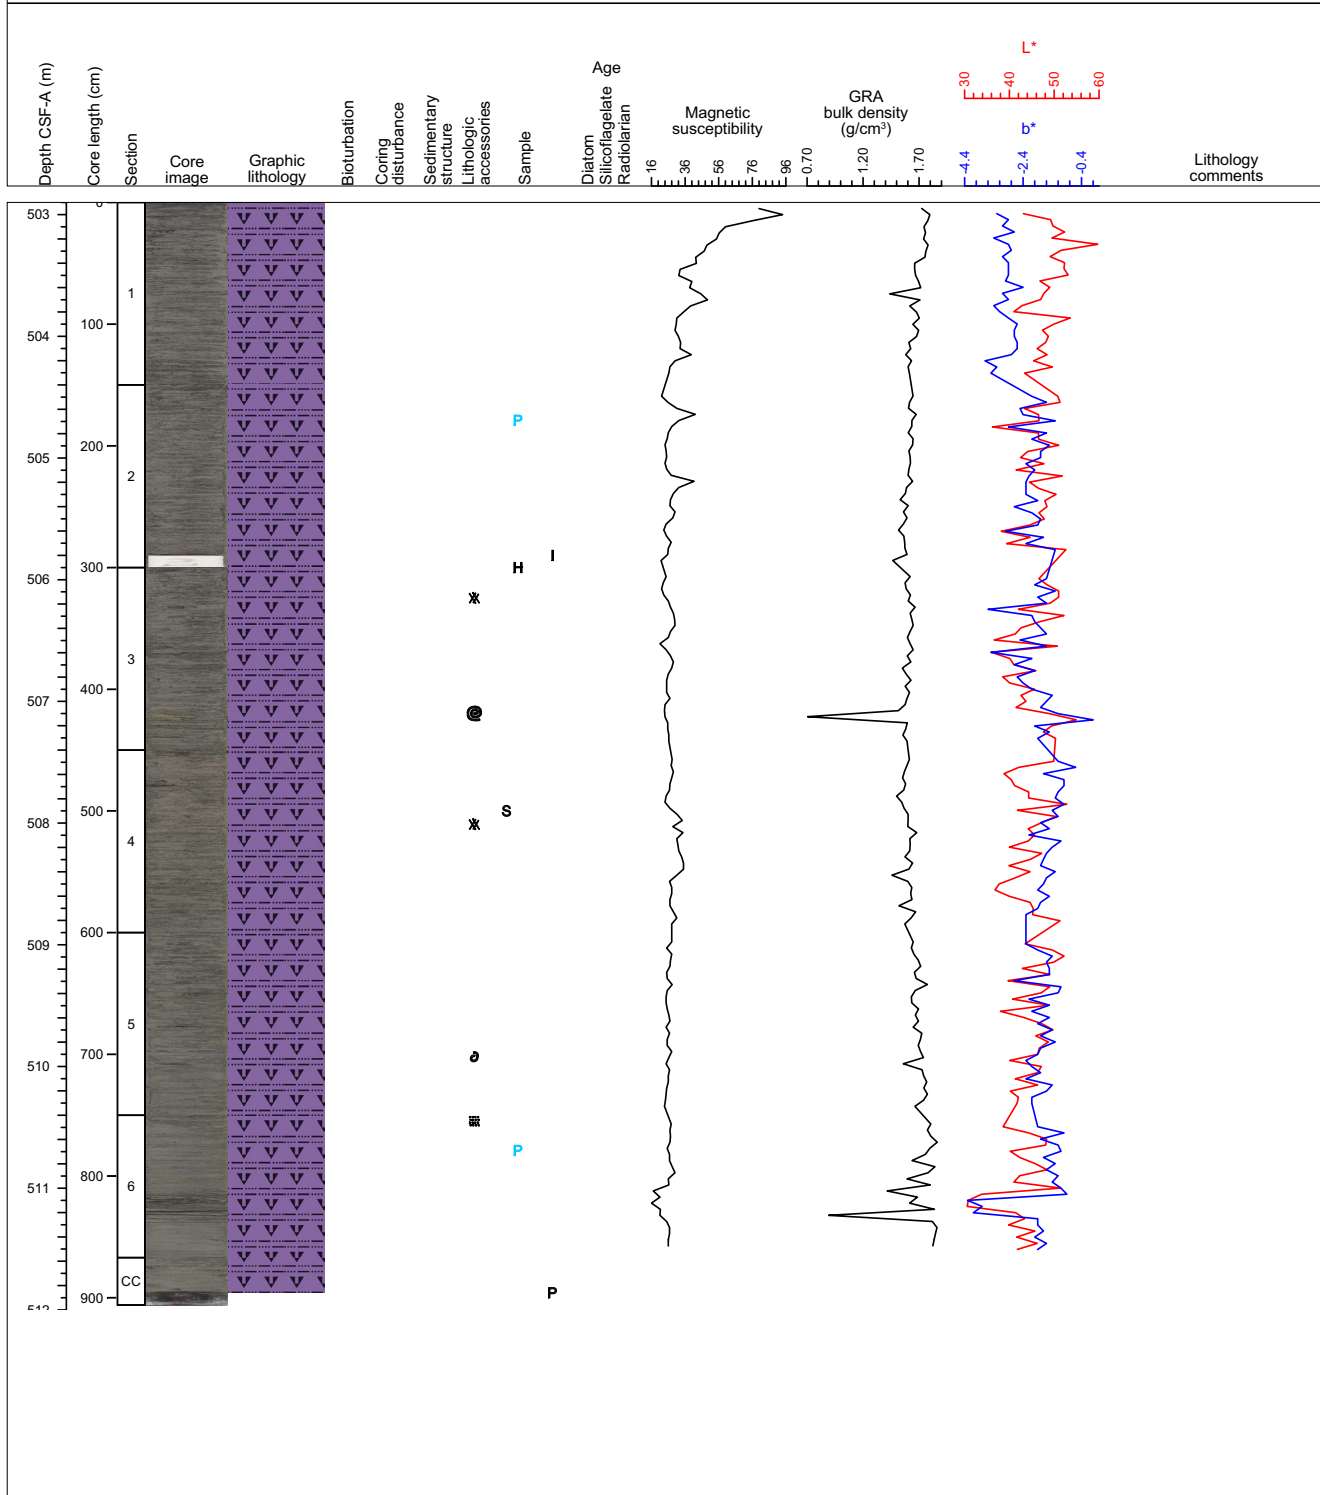

Major lithologies: Soft, very dark gray to dark greenish gray diatom-rich silty clay and diatom-bearing clayey silt; sponge spicule aggregates in sections 1, 2 and 5; authigenic carbonate-rich interval in section 5; bioturbation not visible due to XCB coring; slight drilling disturbance

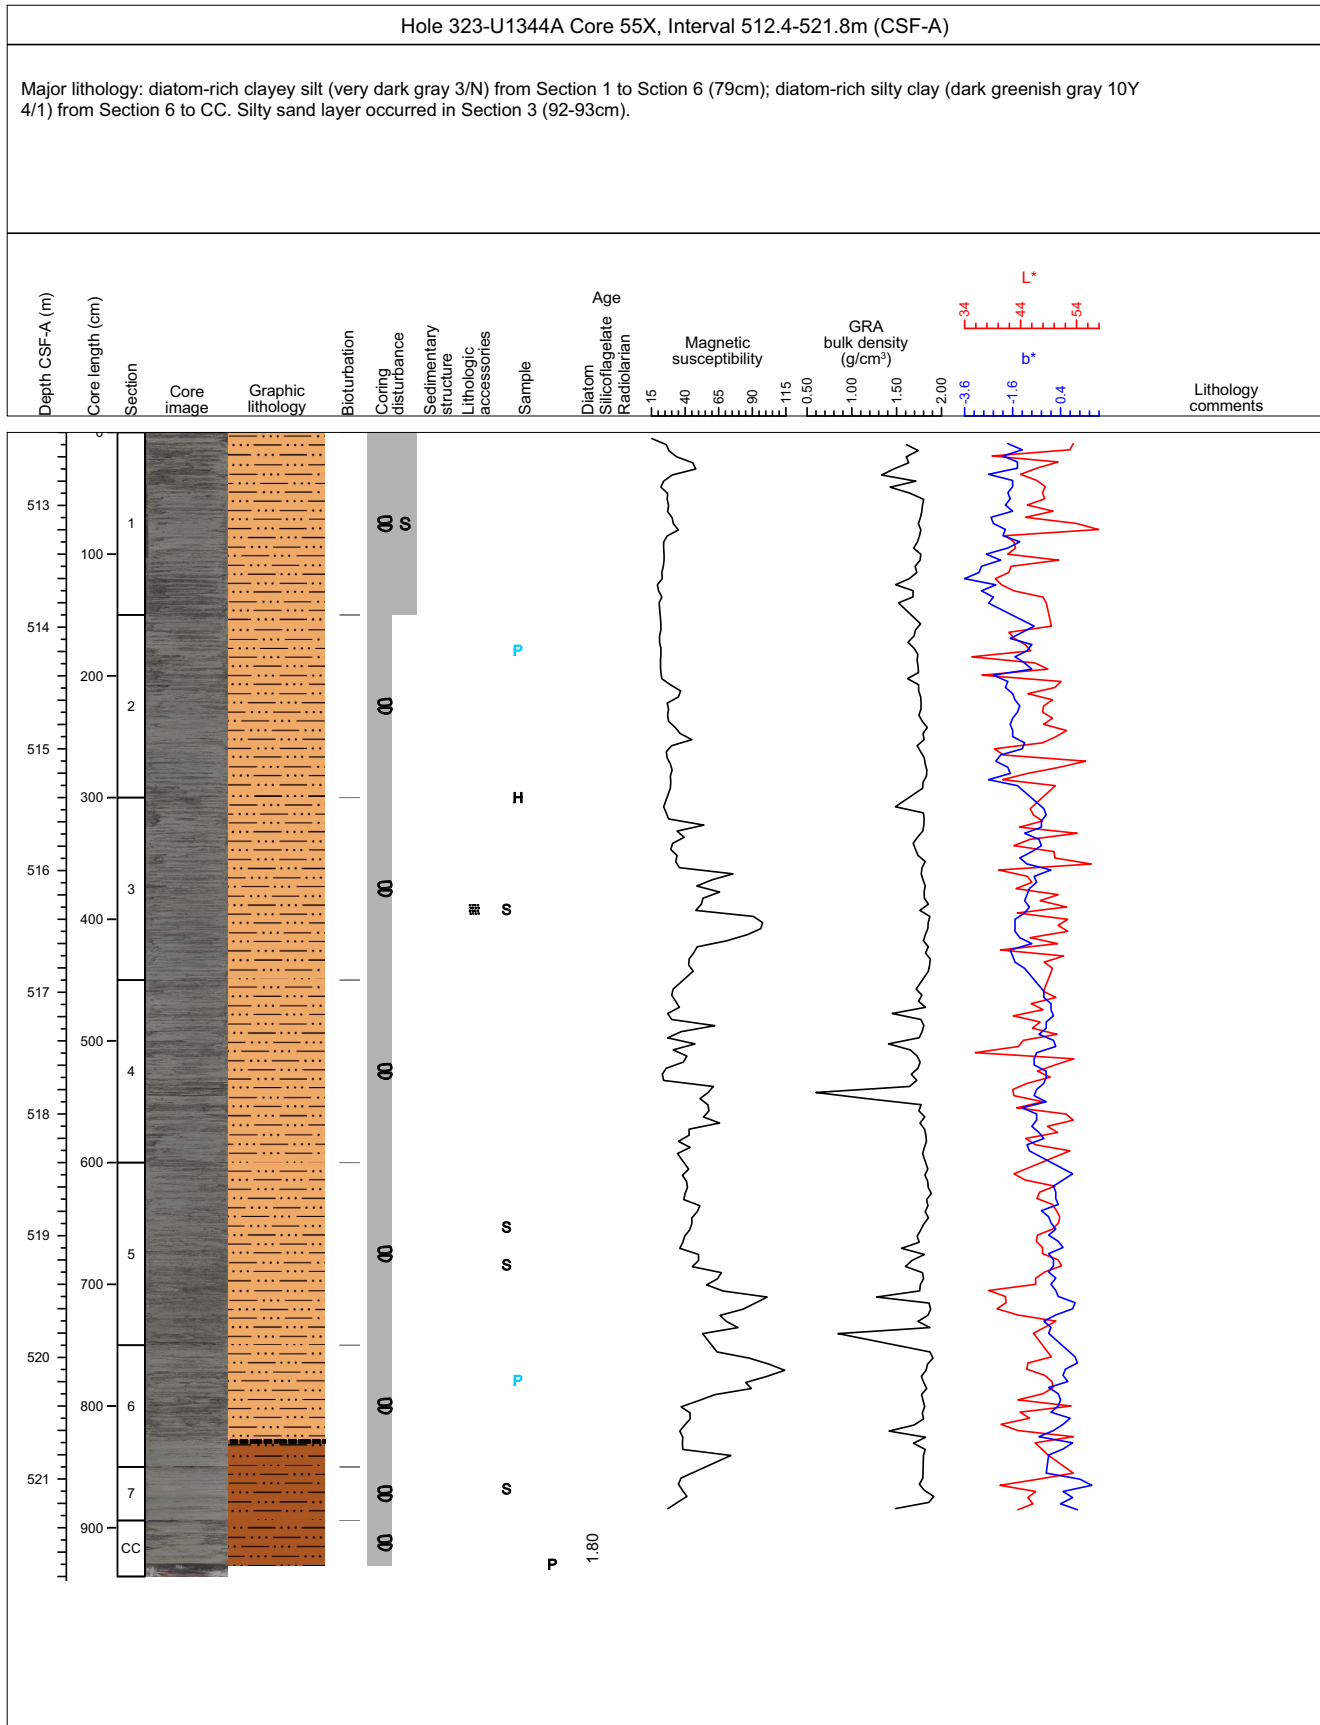

### Core Photo

Hole 323-U1344A Core 54X, Interval 502.9-511.96m (CSF-A)

Major lithologies: Soft, dark greenish gray diatom silty clay; small dolostone nodule in section 3; shell fragment in section 5; bioturbated sandy layer and small sandy mottles in section 6; bioturbation not visible due to XCB coring; slight drilling disturbance

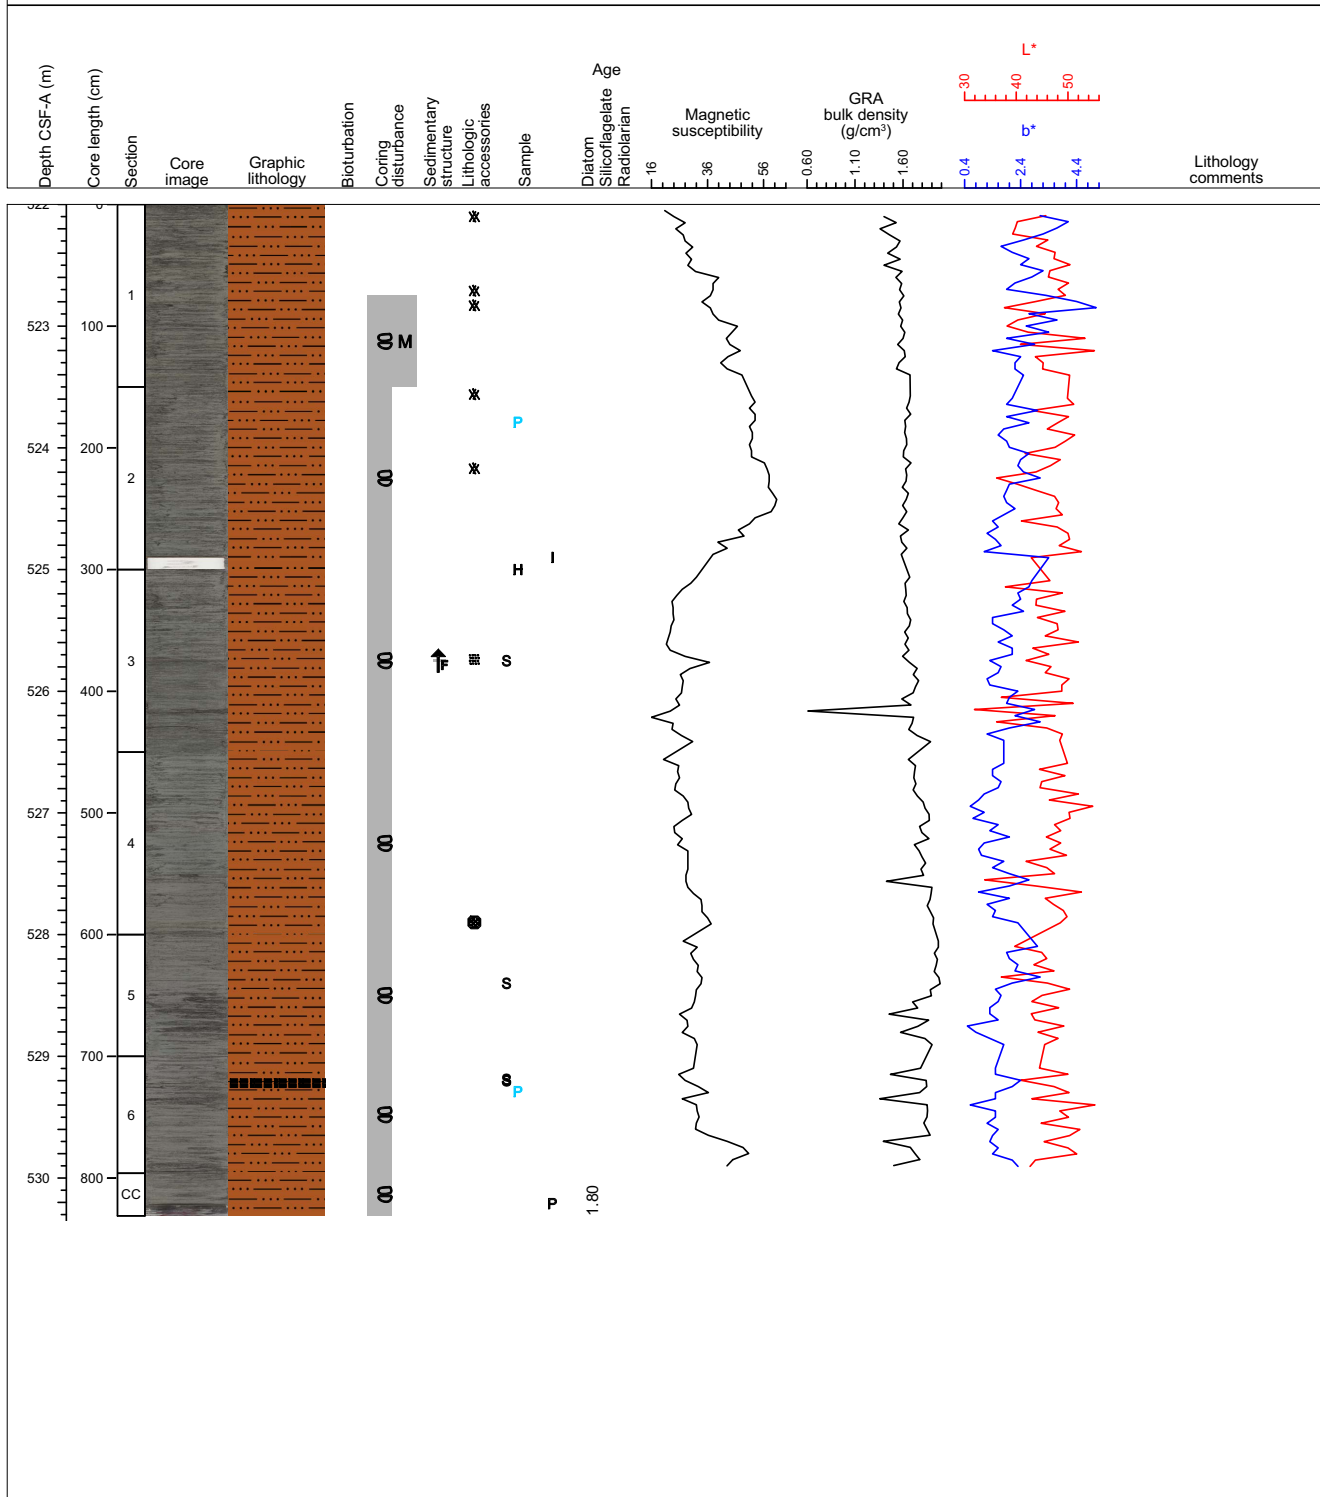

### Core Photo

### Core Photo

Hole 323-U1344A Core 56X, Interval 522.0-530.31m (CSF-A)

Major lithologies: very dark greenish gray diatom-bearing silty clay and diatom-rich silty clay. Gradational boundaries exist between the 2 lithologies. One fining upwards sand layer is present in section 3 just above an isolated pebble. Bioturbation is not apparent due to biscuiting from drilling disturbance. The top half of section 1 was extruded onto the rig floor.

### Core Photo

Hole 323-U1344A Core 57X, Interval 531.7-540.28m (CSF-A)

Major lithology: very dark greenish gray diatom-rich silty clay. Authigenic carbonates are present intermittently in smear slides, but no obvious color or texture change is apparent except in section 5 from 140-143 cm. Light colored mottles occur throughout and may reflect high concentrations of authigenic carbonate. Drilling disturbance is moderate throughout with biscuiting. The top of core 1 was extruded onto the rig floor.

### Core Photo

Hole 323-U1344A Core 58X, Interval 541.3-549.57m (CSF-A)

The main lithology is very dark gray diatom-rich clayey silt. A secondary lithology, very dark greenish gray diatom silty clay, appears only in the CC. Two greenish gray authigenic carbonate-rich layers about 10 cm thick were observed in sections 1 and 3. Drilling disturbance is moderate to severe.

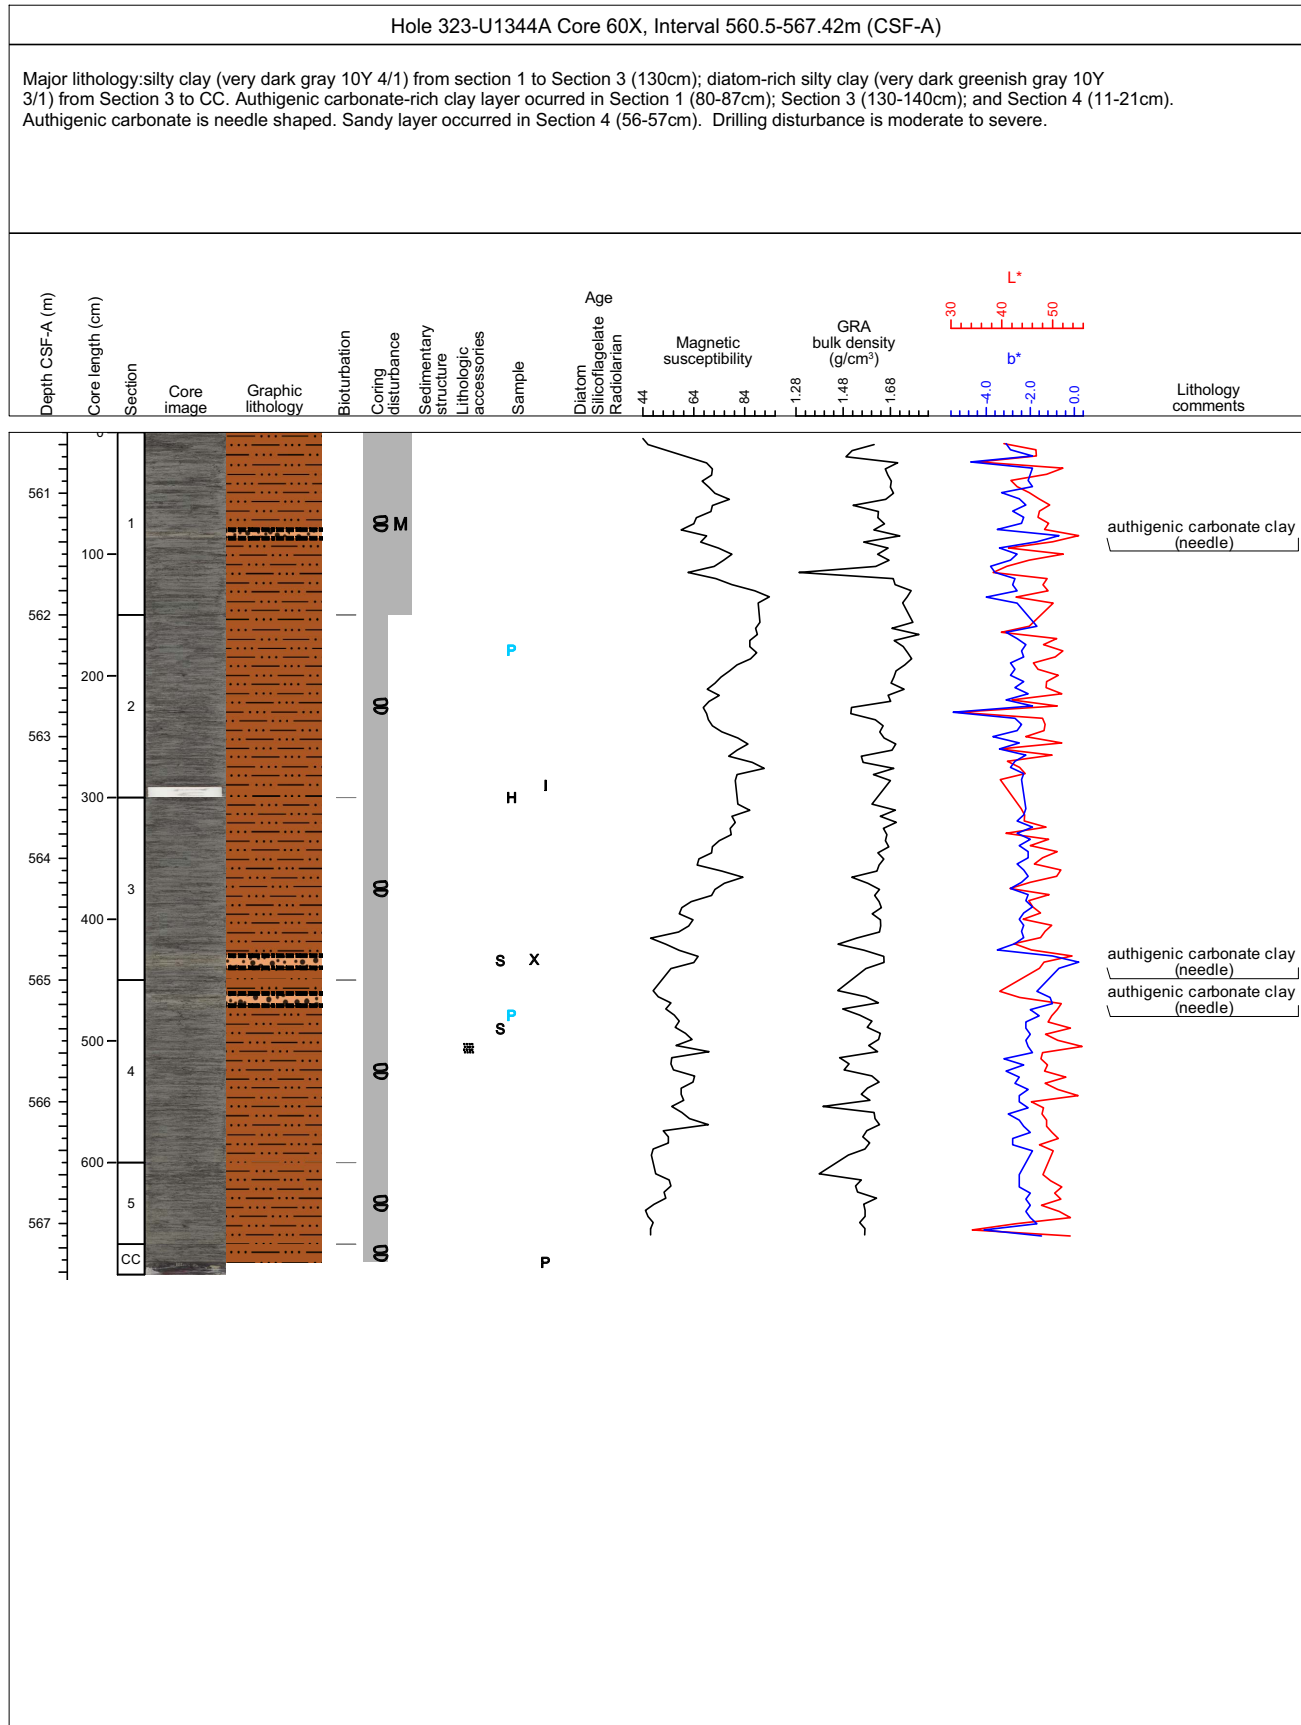

### Core Photo

Hole 323-U1344A Core 59X, Interval 550.9-558.79m (CSF-A)

Major lithology is silty clay (very dark gray 3/N) from Section 2 to CC. Secondary lithology is diatom silty clay (very dark greenish gray 10Y 3/1). Authigenic carbonate concretion occurred in Section 4 (13-17cm). Drilling disturbance is moderate to severe.

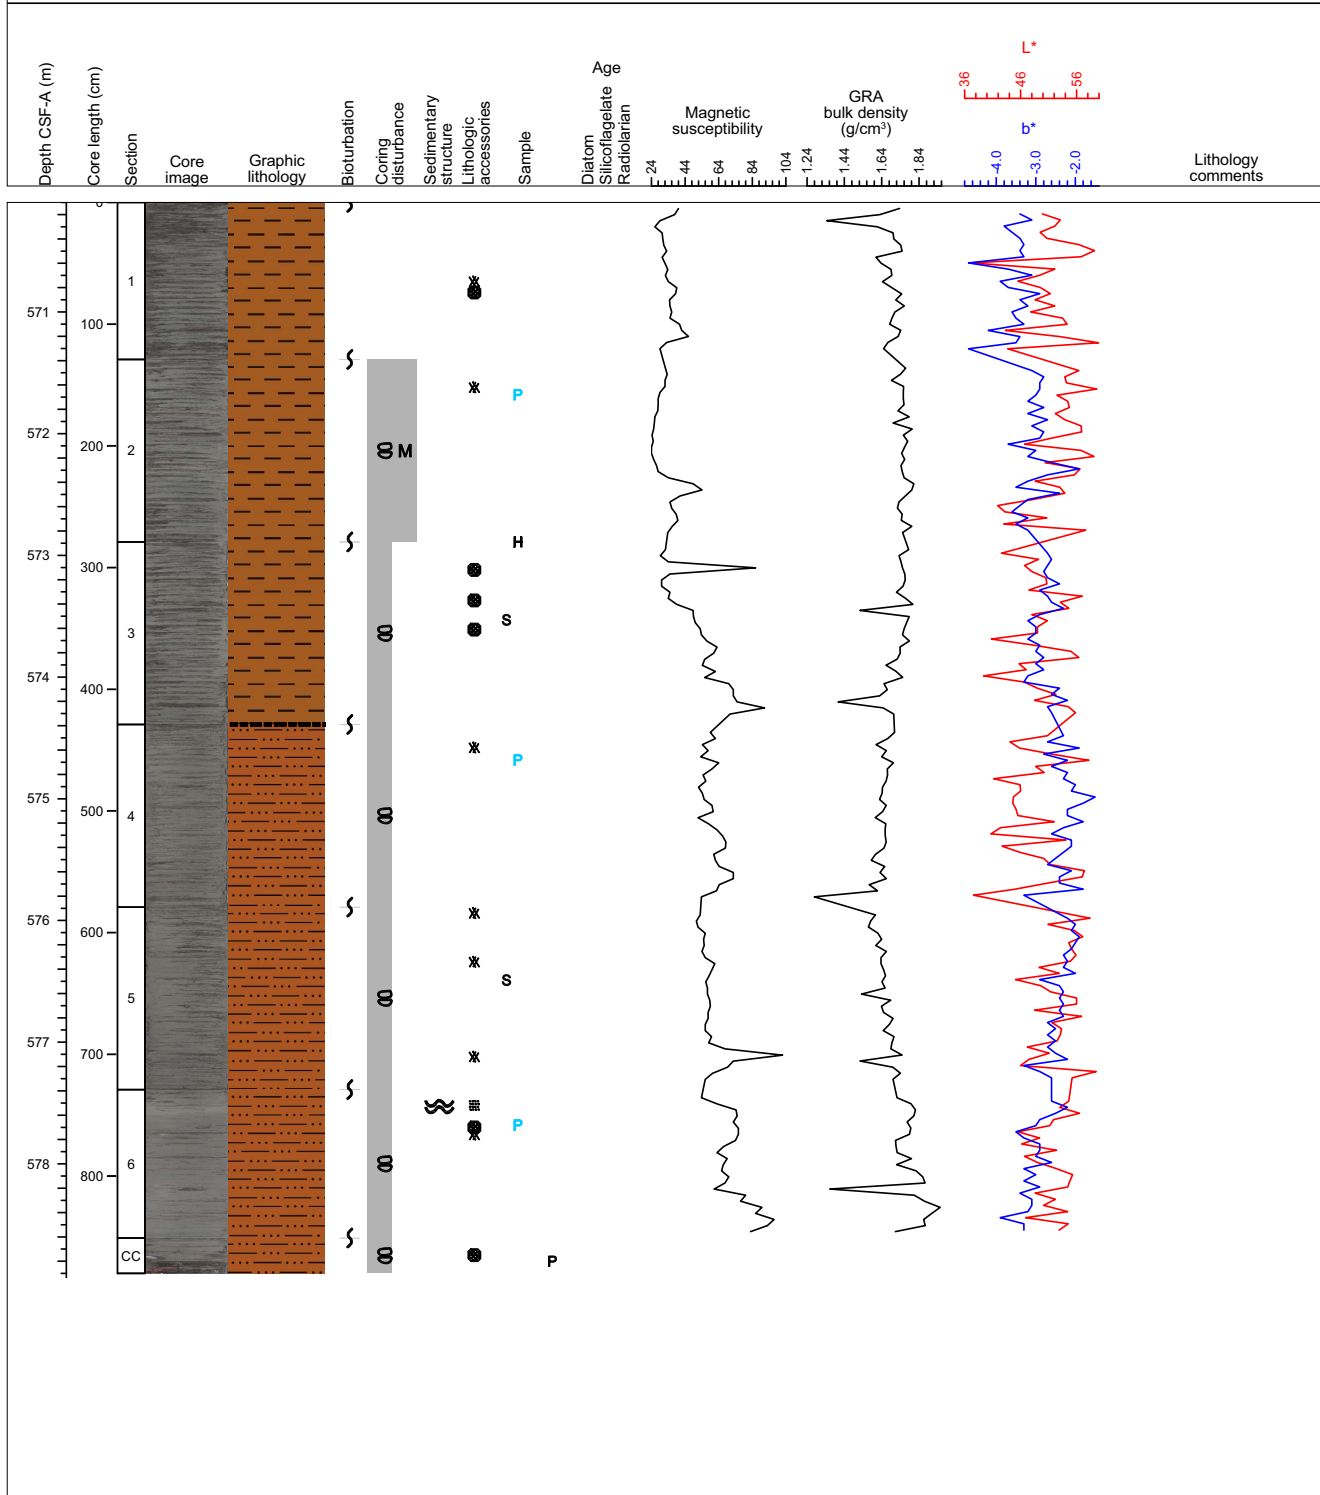

### Core Photo

### Core Photo

Hole 323-U1344A Core 61X, Interval 570.1-578.9m (CSF-A)

Major lithologies: greenish black diatom-bearing clay and dark greenish gray diatom-rich silty clay. The boundary between the 2 lithologies is gradational. Two 4 cm thick authigenic carbonate rich layers are present in section 2. Several pebbles and granules are found throughout. One thin sand layer is present in section 6. It has a sharp, undulating lower contact and a gradational, bioturbated upper contact. Drilling disturbance is moderate to severe throughout with biscuiting present throughout. Section 1 was extruded onto the rig floor.

### Core Photo

Hole 323-U1344A Core 62X, Interval 579.8-587.61m (CSF-A)

Major lithology: diatom-bearing silty clay (very dark greenish gray 10Y 3/1); diatom-rich clayey silt (very dark gray 3/N). Sandy layer occurred in Section 3 (31-32cm; 44-47cm) and Section 4 (10-103cm). Brown ash layer occurred in Section 2 (0-1cm). Drilling disturbance is moderate to severe.

### Core Photo

Hole 323-U1344A Core 63X, Interval 589.4-596.29m (CSF-A)

The main lithology is very dark greenish gray diatom-bearing silty clay. The sediment becomes diatom-rich silty clay in sections 5 and CC. A greenish gray authigenic carbonate layers occurs near the top of section 4. The core shows moderate drilling disturbance (biscuits) throughout.

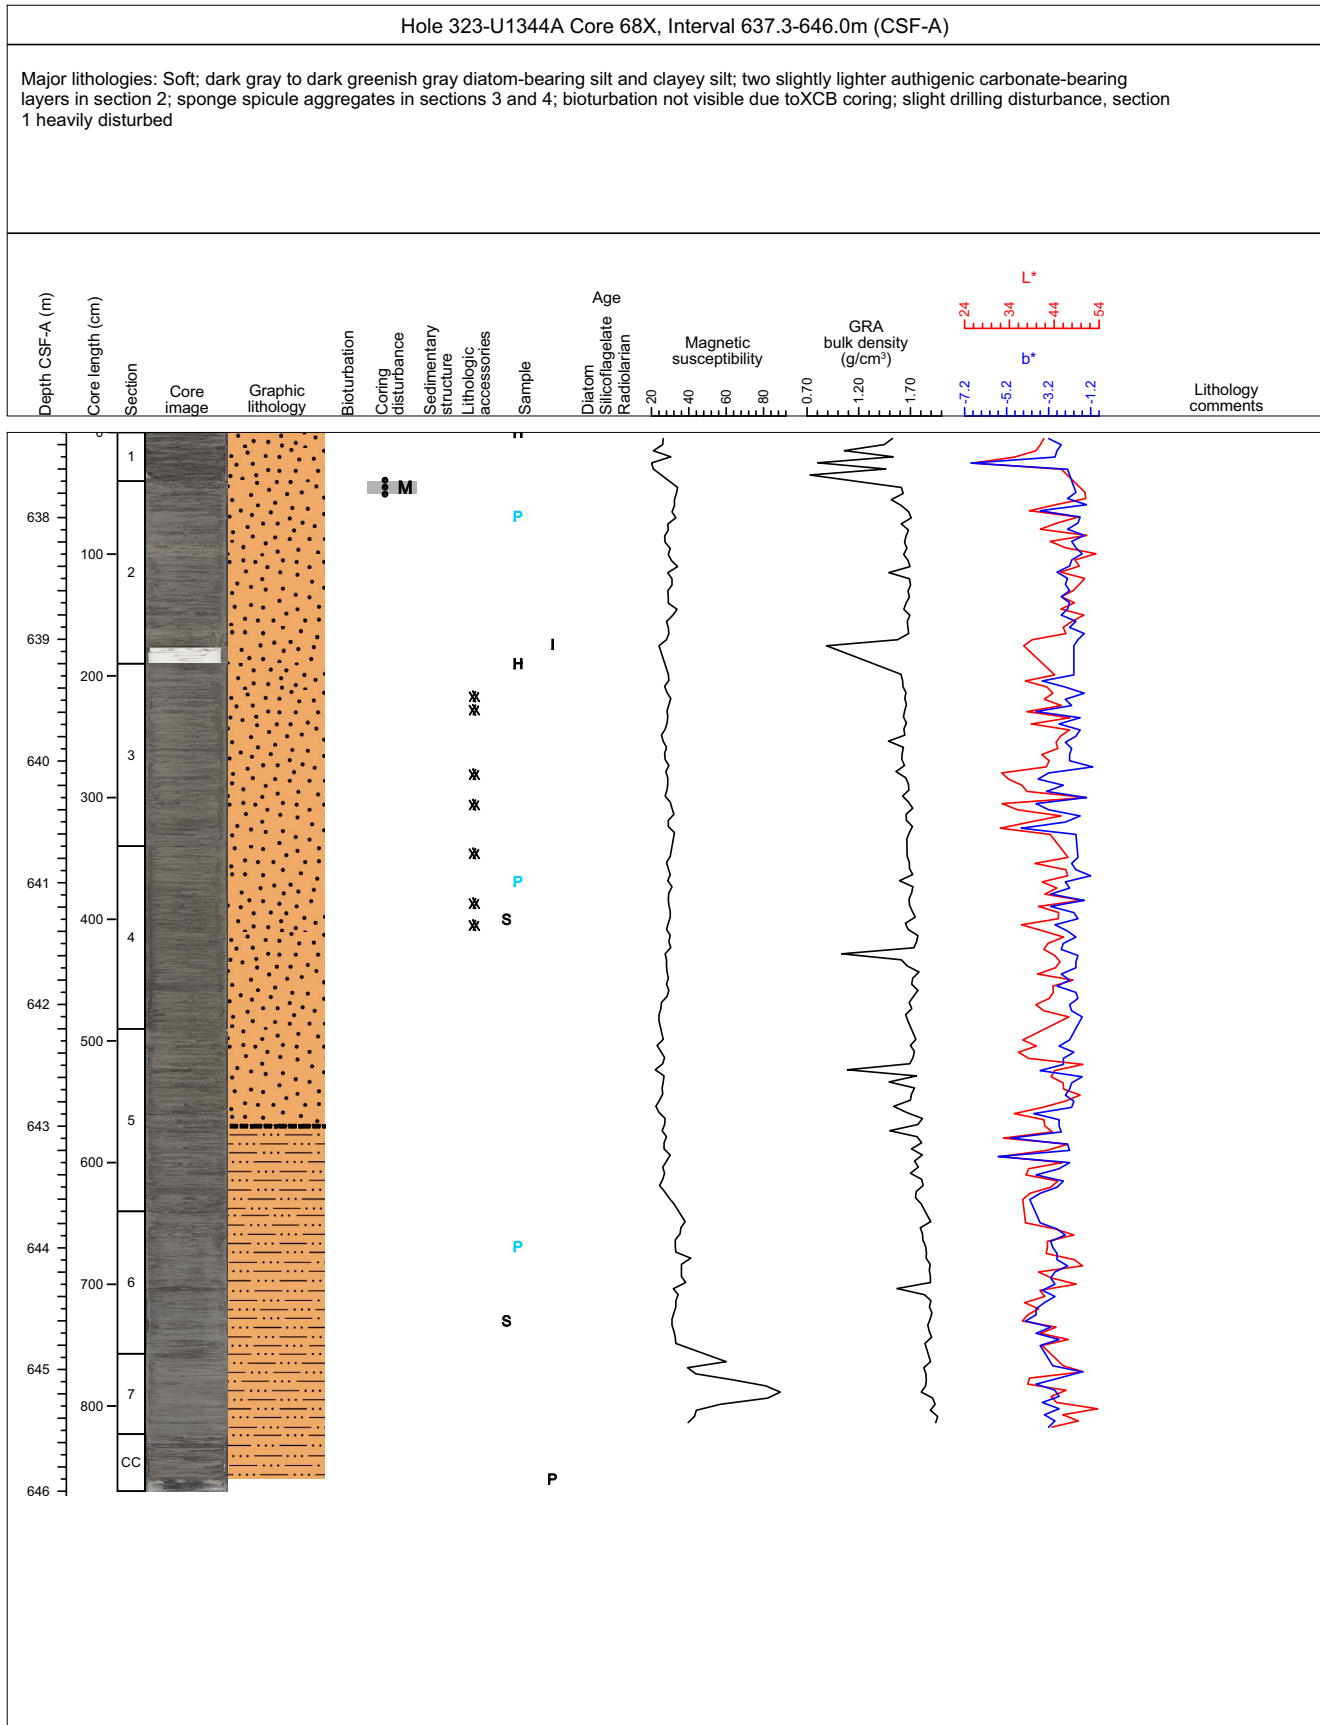

### Core Photo

Hole 323-U1344A Core 65X, Interval 608.5-618.08m (CSF-A)

The main lithology is very dark greenish grey diatom-rich clayey silt. There are clasts in sections 1, 3 and 4, sponge spicule aggregates throughout, sandy patches and layers, and authigenic carbonate in sections 4 and 7. Bioturbation is not visible. There is slight to no drilling disturbance.

### Core Photo

## Core Photo

Hole 323-U1344A Core 69X, Interval 646.9-647.34m (CSF-A)

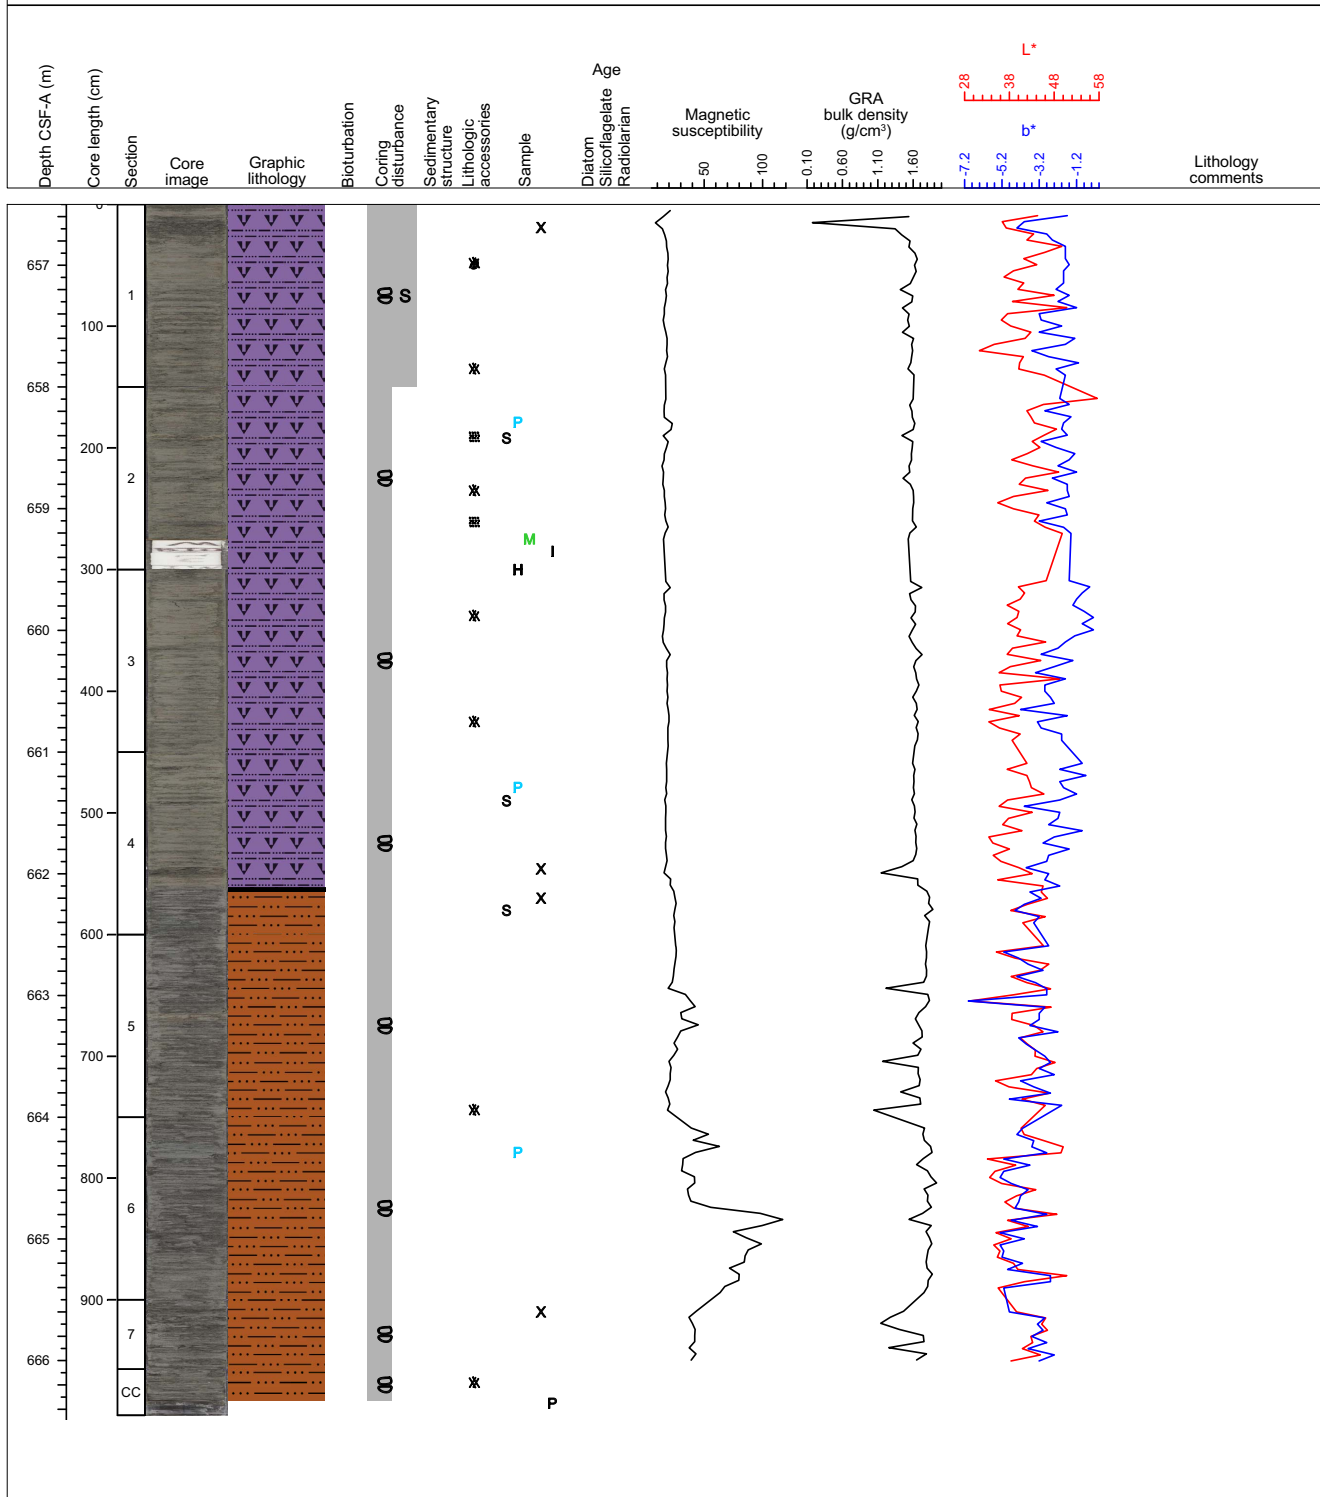

Major lithologies: Soft, dark gray ditom-rich silt; no bioturbation visible due to moderate drilling disturbance; only CC, blocked at the lower end by cobble of plutonic rock

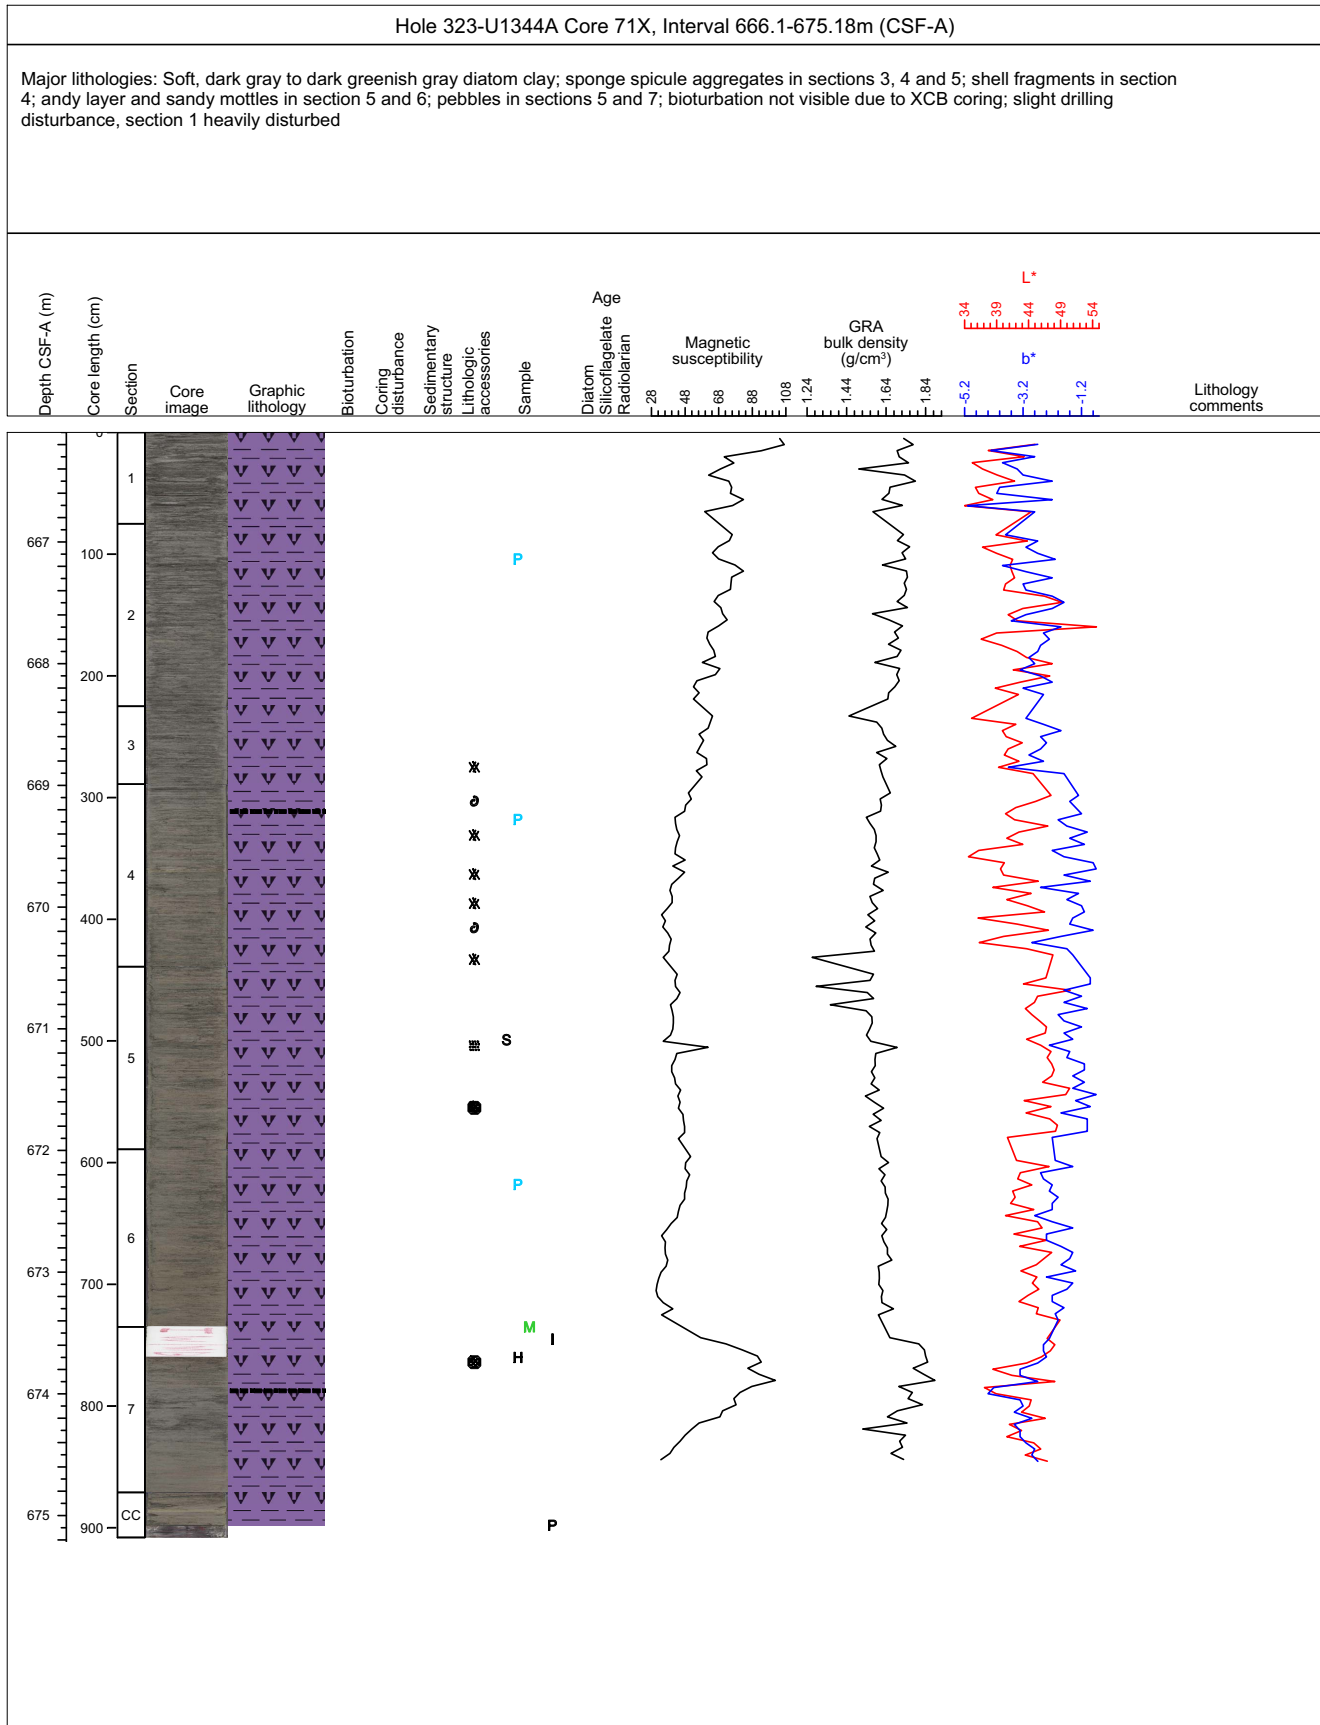

### Core Photo

Hole 323-U1344A Core 70X, Interval 656.5-666.45m (CSF-A)

The main lithologies are dark greenish grey diatom silty clay and greenish black diatom-rich silty clay. There is a sharp boundary between them in section 4. There are black sandy mottles and laminae and sponge spicule aggregates throughout the core but more predominant in the upper sections. Authigenic carbonate occurs in sections 2 and 5. Bioturbation is not visible. The lower part of the core shows biscuiting.

### Core Photo

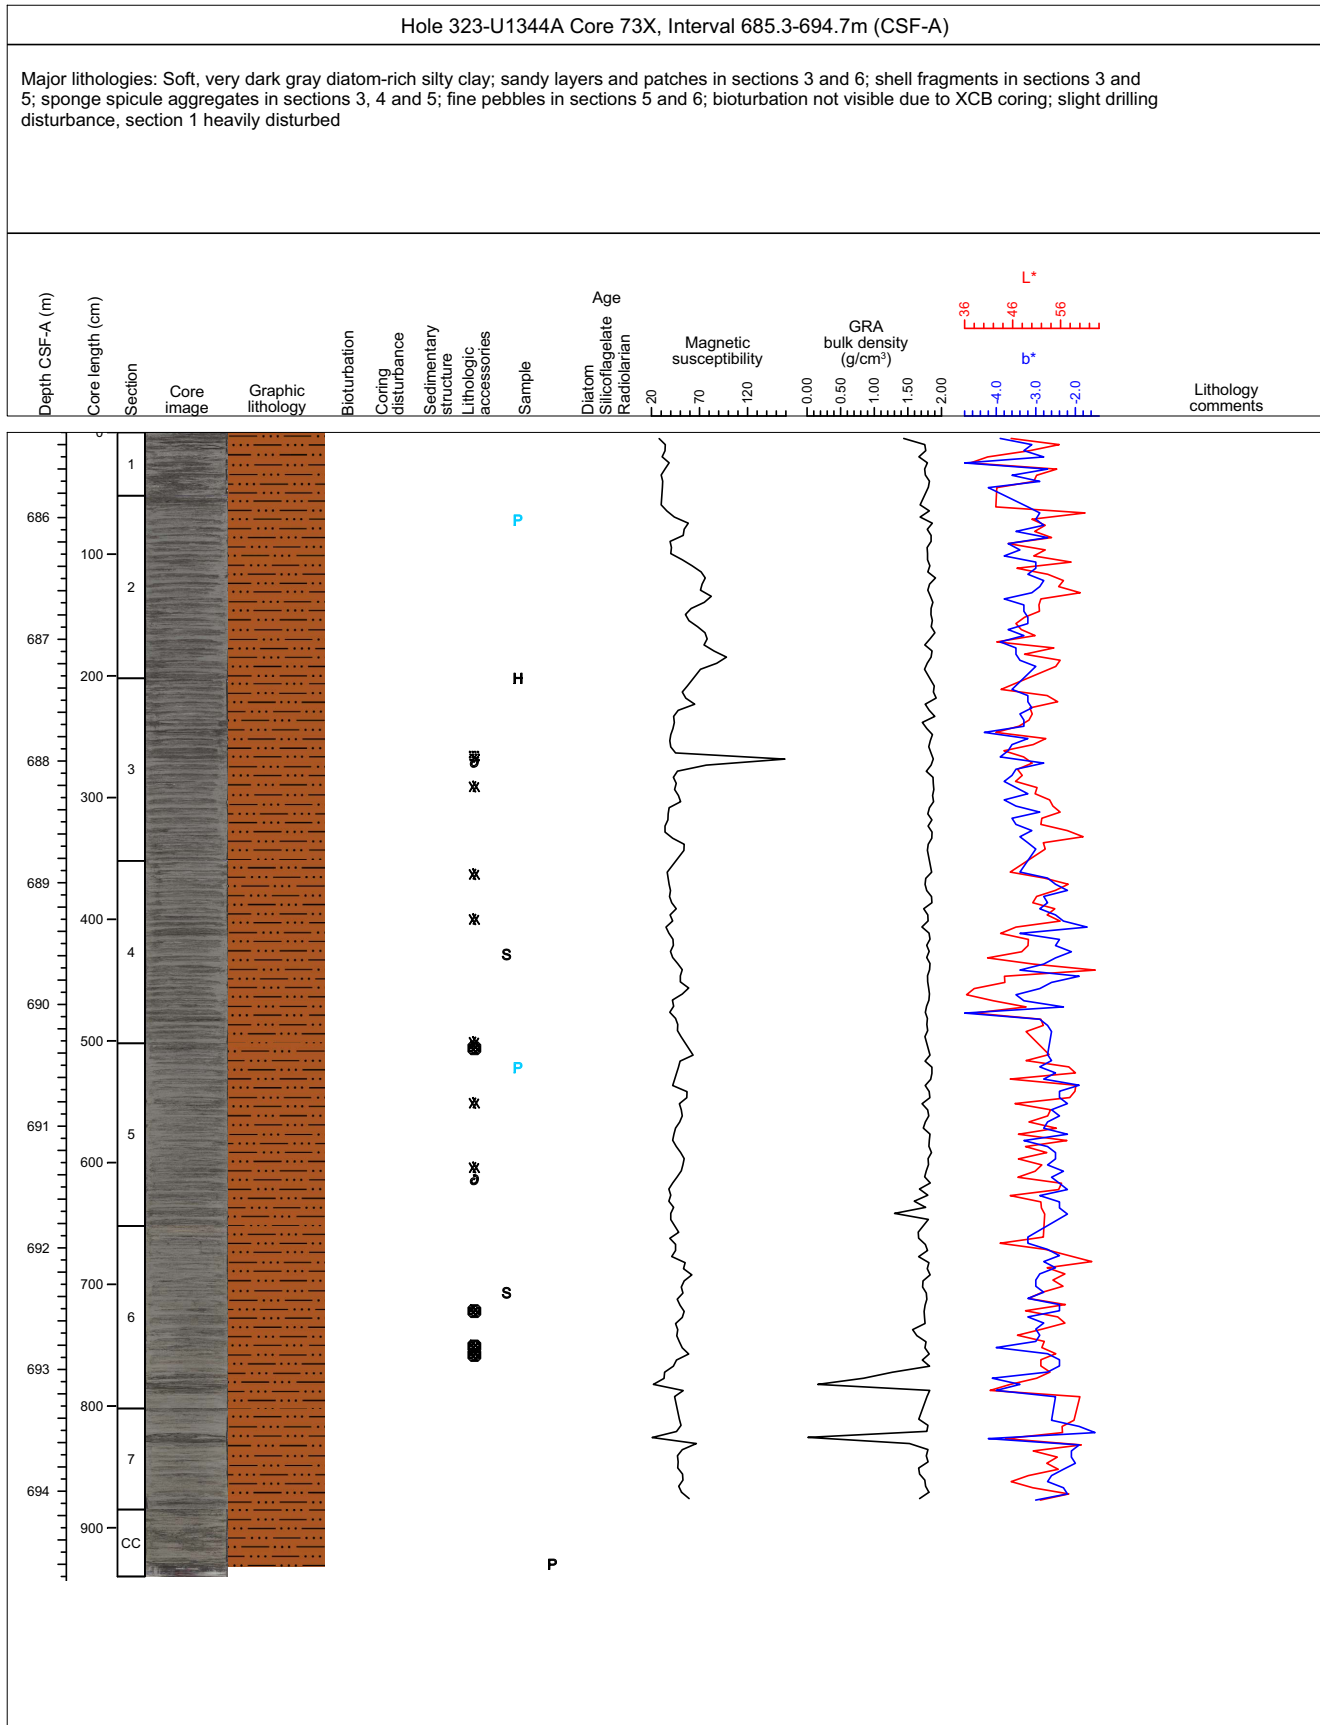

### Core Photo

Hole 323-U1344A Core 72X, Interval 675.7-683.55m (CSF-A)

The main lithologies are very dark greenish grey diatom-rich clay and dark greenish gray diatom-rich silty clay. There are numerous sponge spicule aggregates and sandy patches but most occur in the diatom-rich silty clay. Bioturbation is not visible. Drilling disturbance is mostly slight with biscuiting.

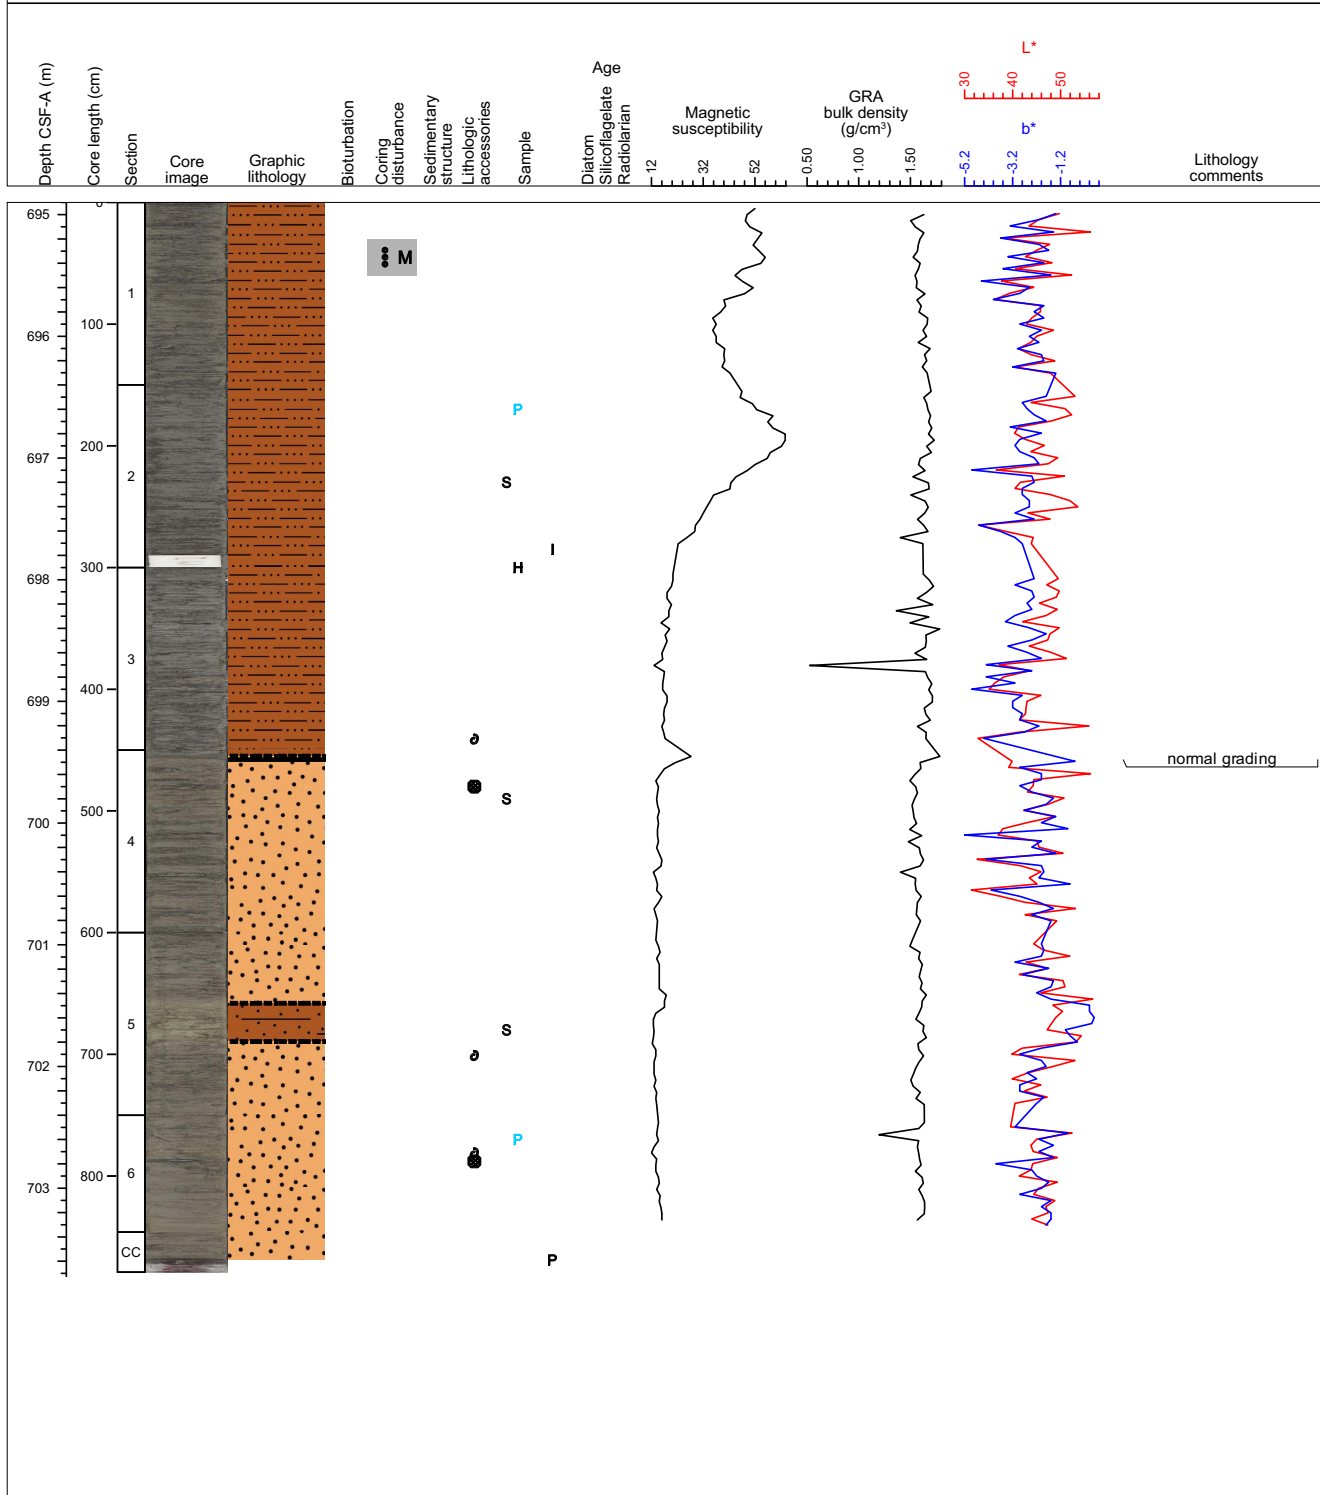

### Core Photo

### Core Photo

Hole 323-U1344A Core 74X, Interval 694.9-703.69m (CSF-A)

Major lithologies: Soft to stiff, very dark to dark greenish gray diatom rich silty and silty clay; mostly gradational boundaries between different colours, but sharp contact below sandy layer in upper section 4; dark, normally graded sandy layer in upper section 4, bioturbated top and sharp, probably erosional base; lighter-coloured authigenic carbonate-rich diatom-rich sandy clay interval in section 5; clasts in sections 4 and 6; shell fragments in sections 3, 5 and 6; sandy mottles in lower section 6 and CC; bioturbation not visible due to XCB coring; slight drilling disturbance, soupy in section 1

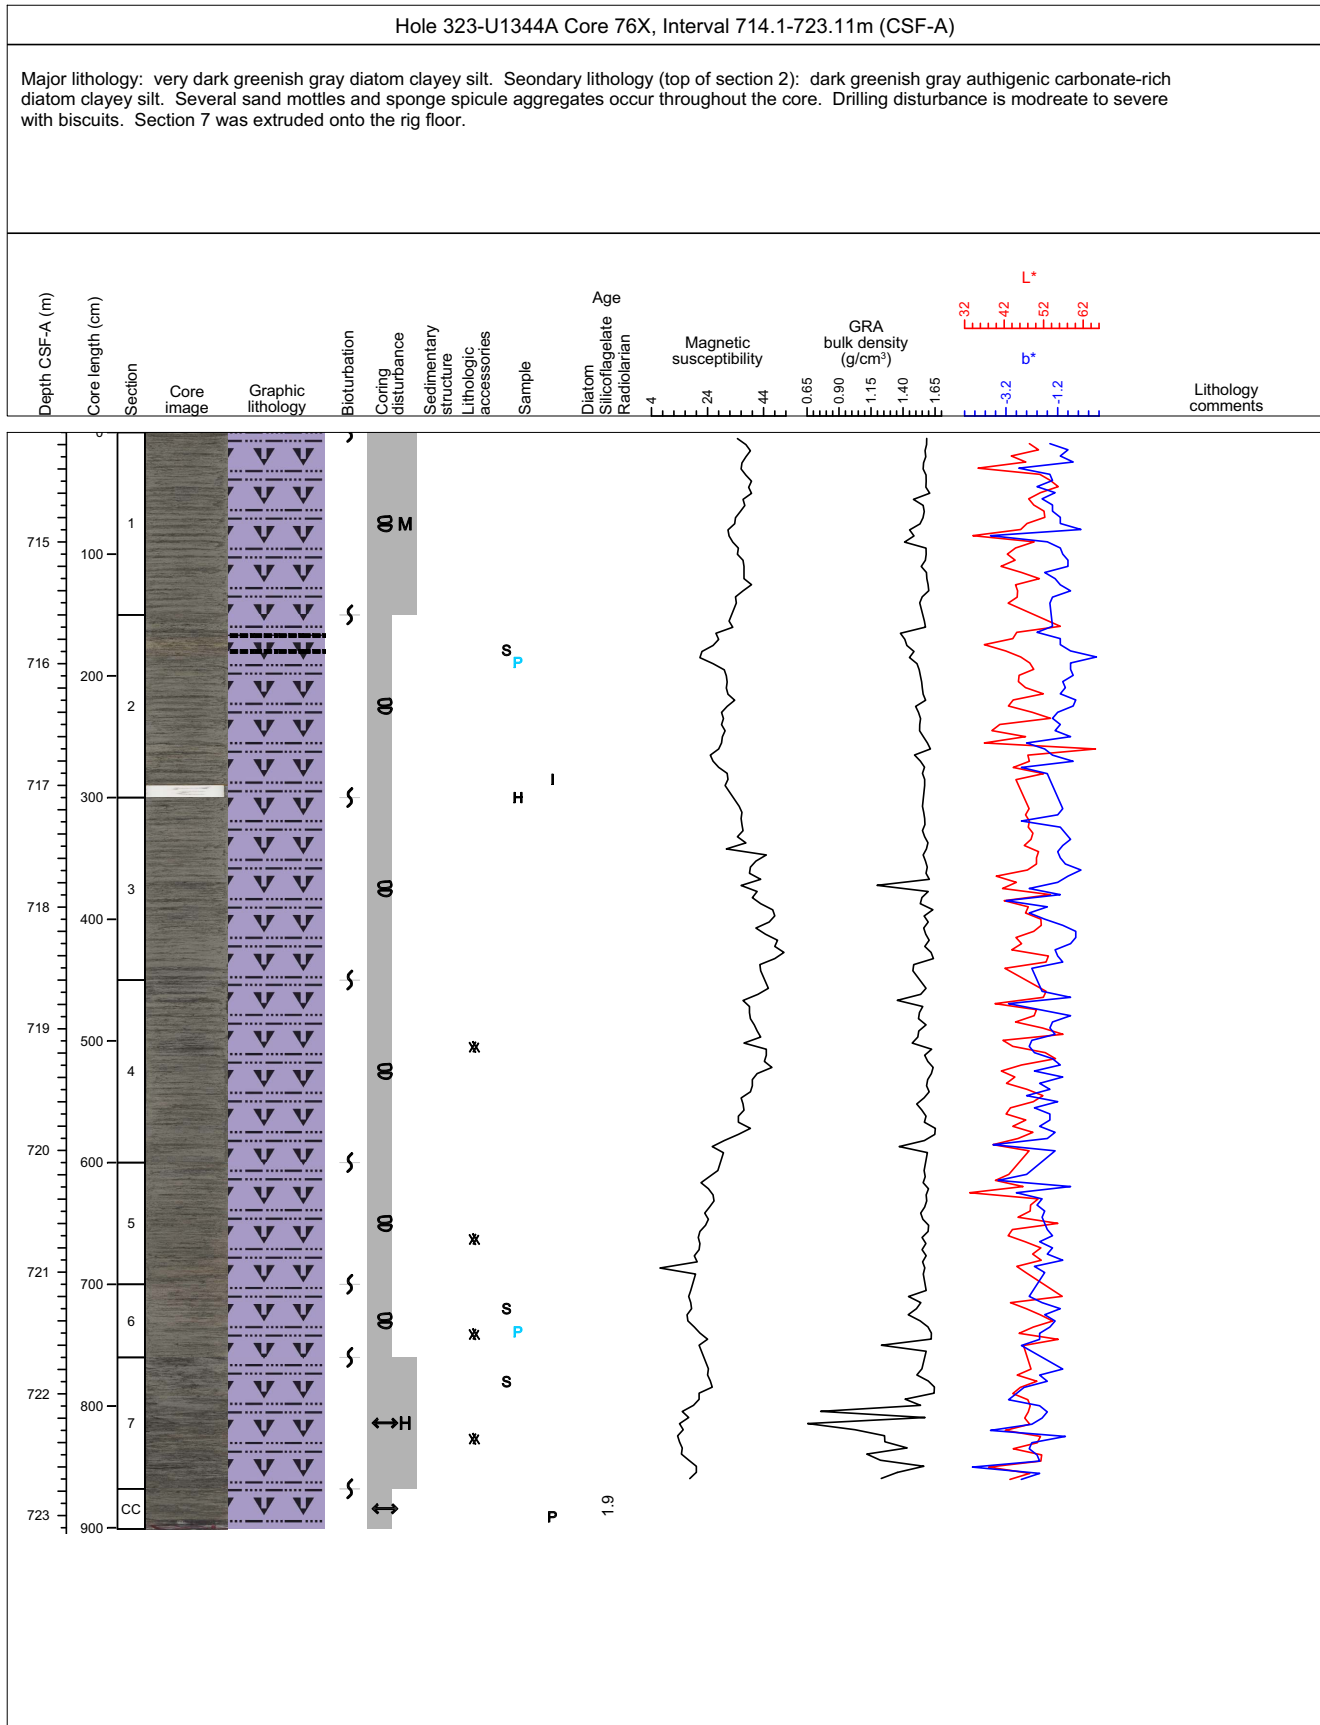

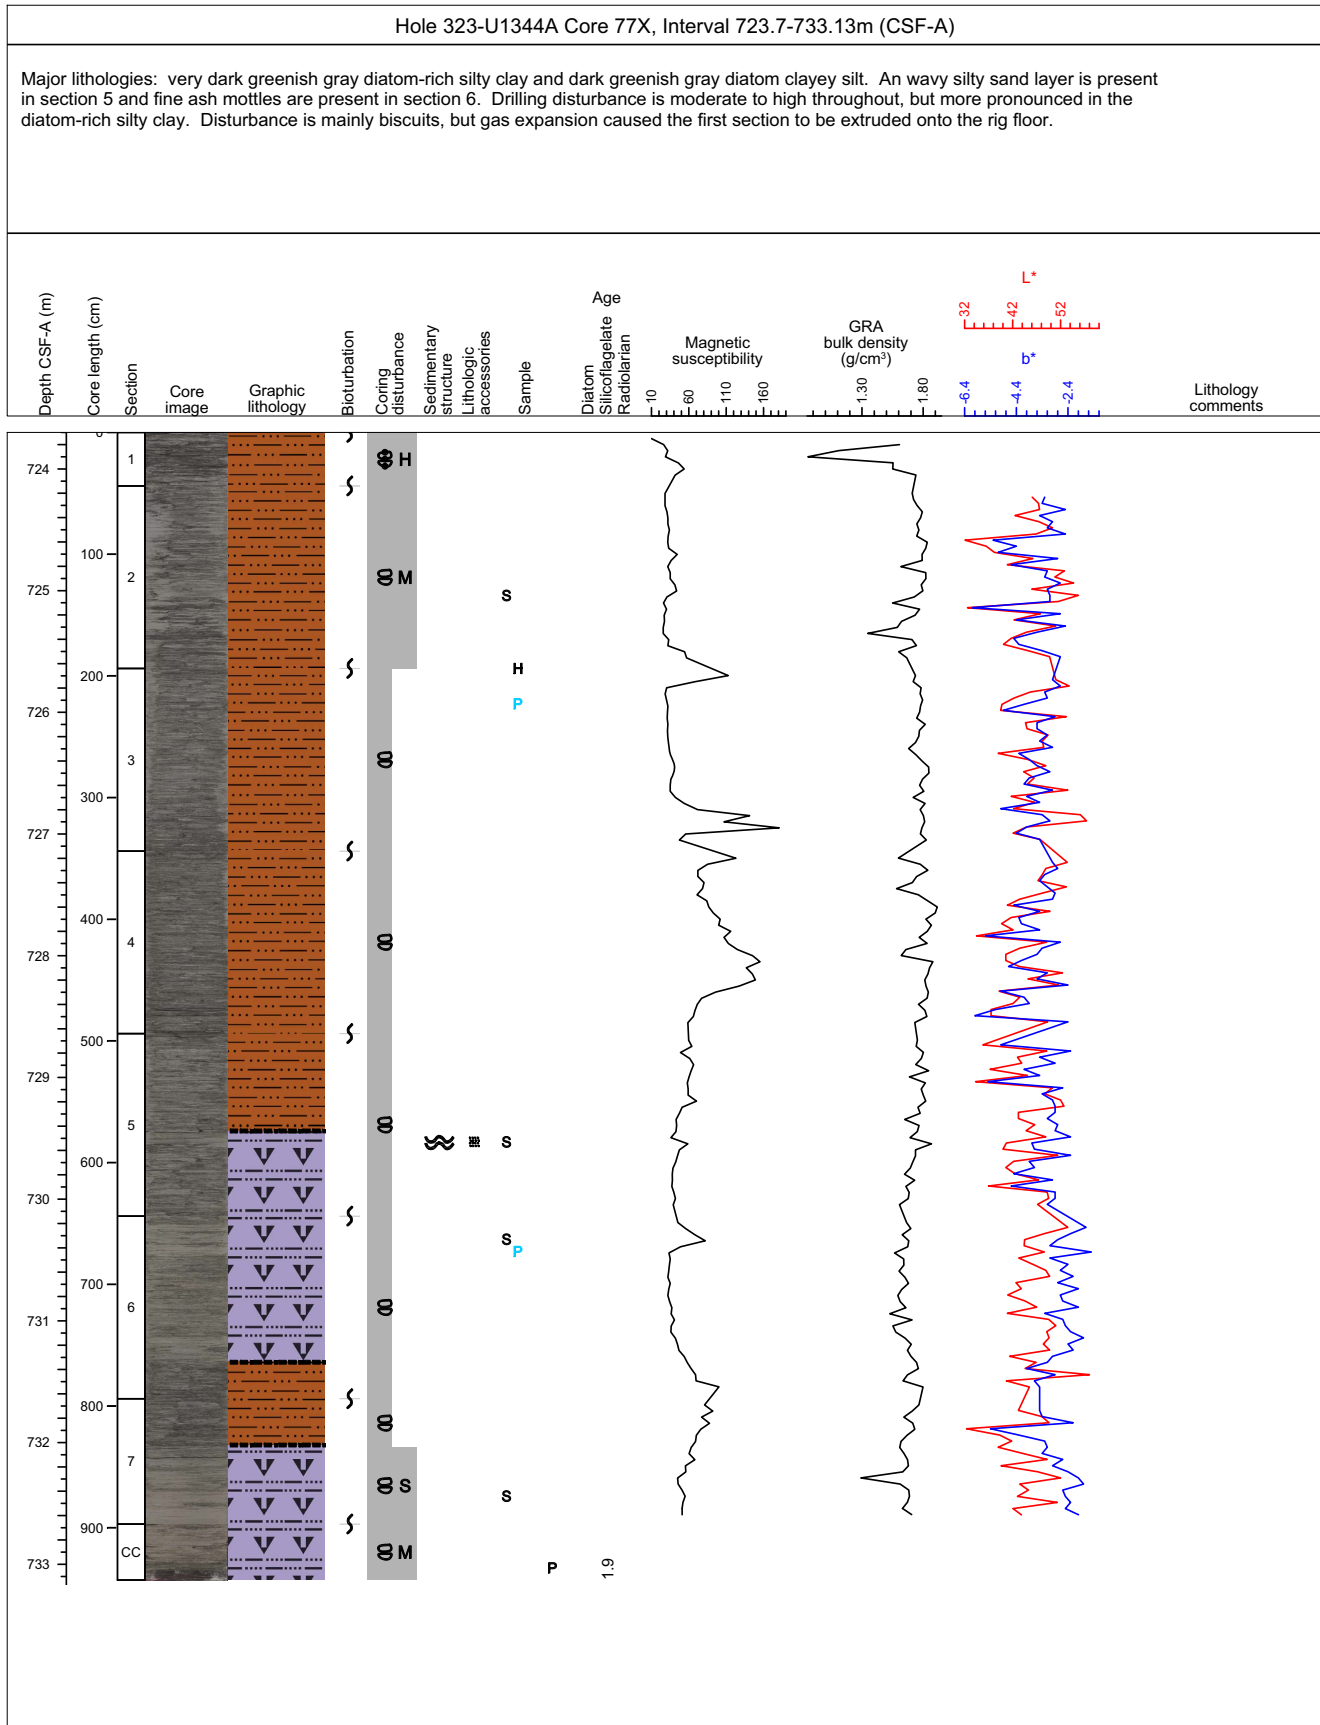

### Core Photo

### Core Photo

### Core Photo

### Core Photo

### Core Photo

Hole 323-U1344A Core 79X, Interval 739.0-746.59m (CSF-A)

Major lithology: greenish black diatom-rich clayey silt. Secondary lithology in section 2: greenish gray authigenic carbonate-rich diatom ooze. Boundaries between lithologies are gradational. Pyrite streaks are visible in section 3. Other structures are obscured by moderate drilling disturbance due to biscuiting.

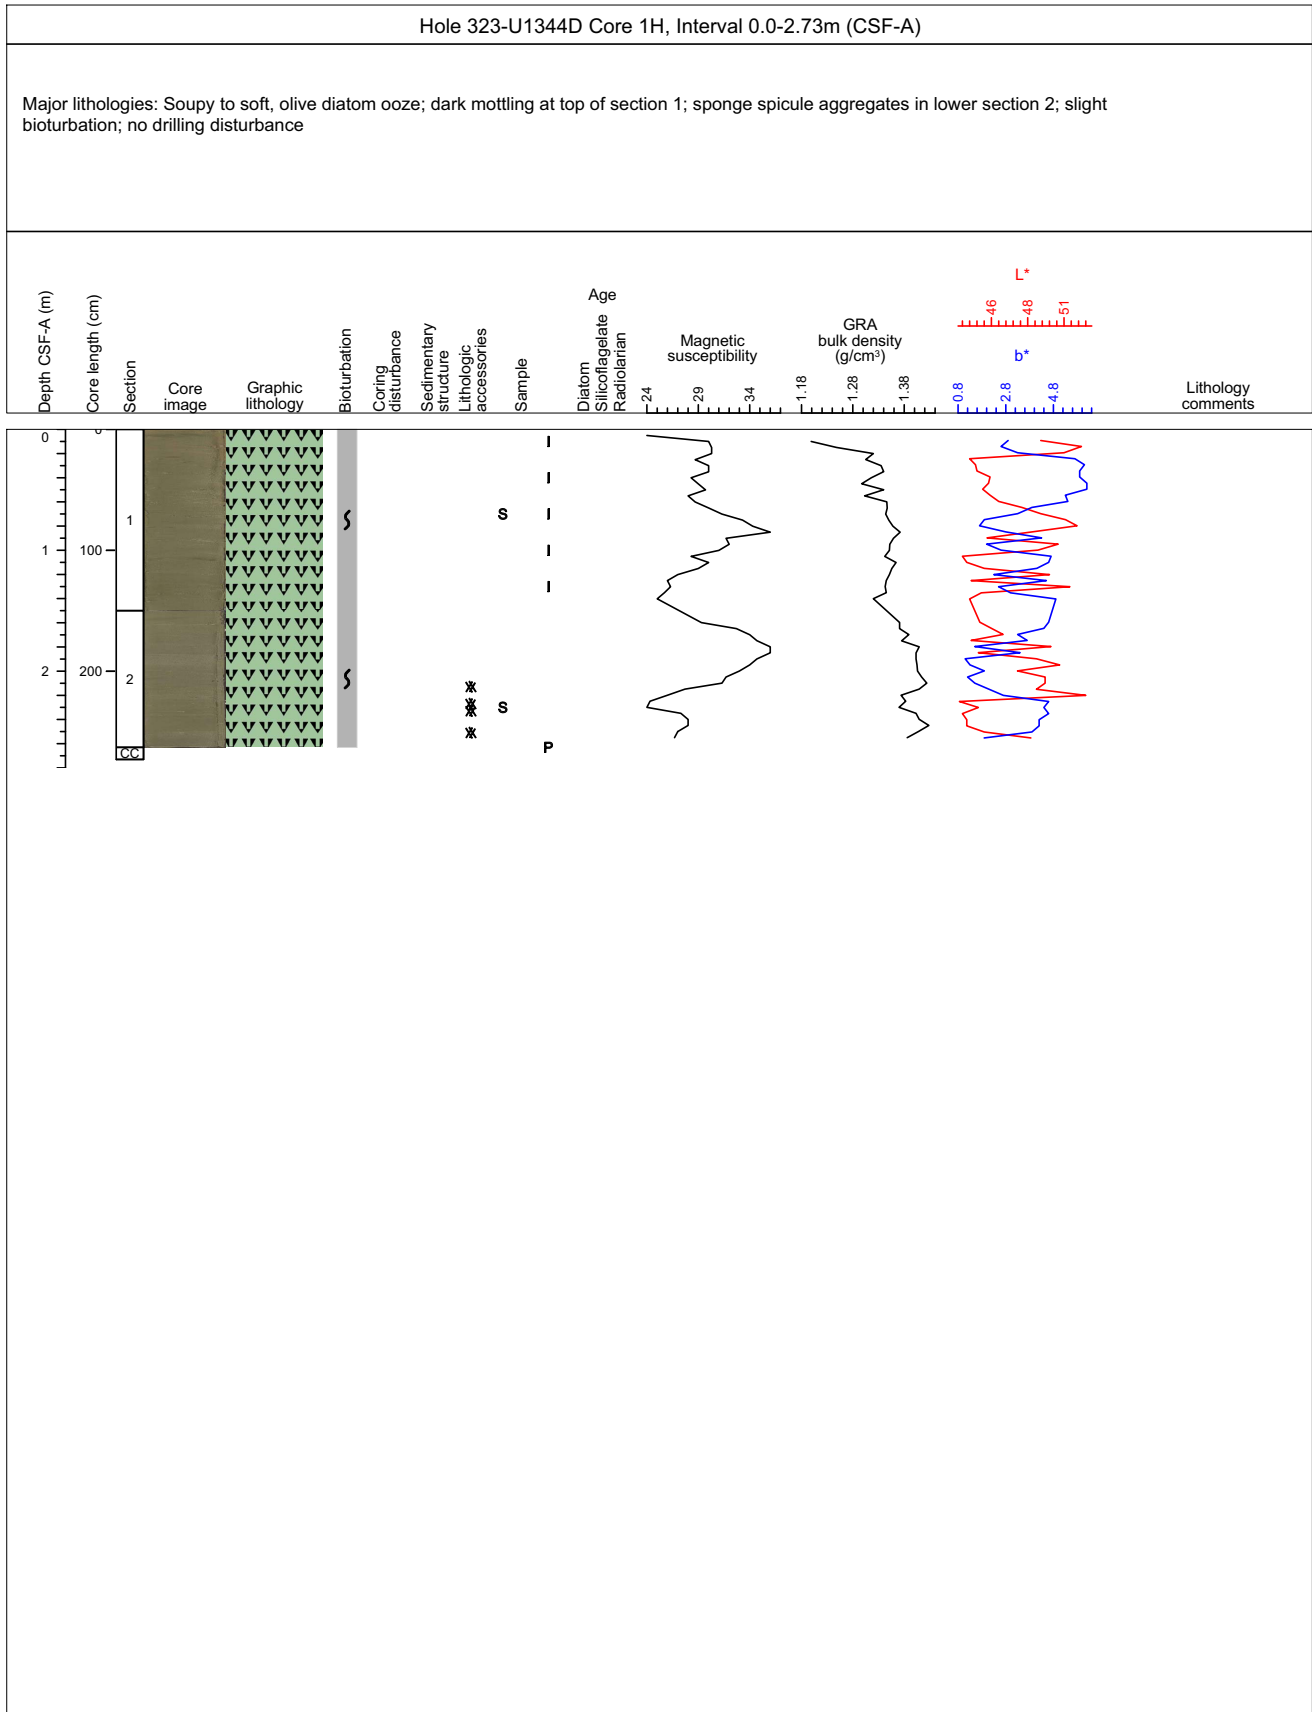

### Core Photo

Hole 323-U1344B Core 1H, Interval 0.0-4.8m (CSF-A)

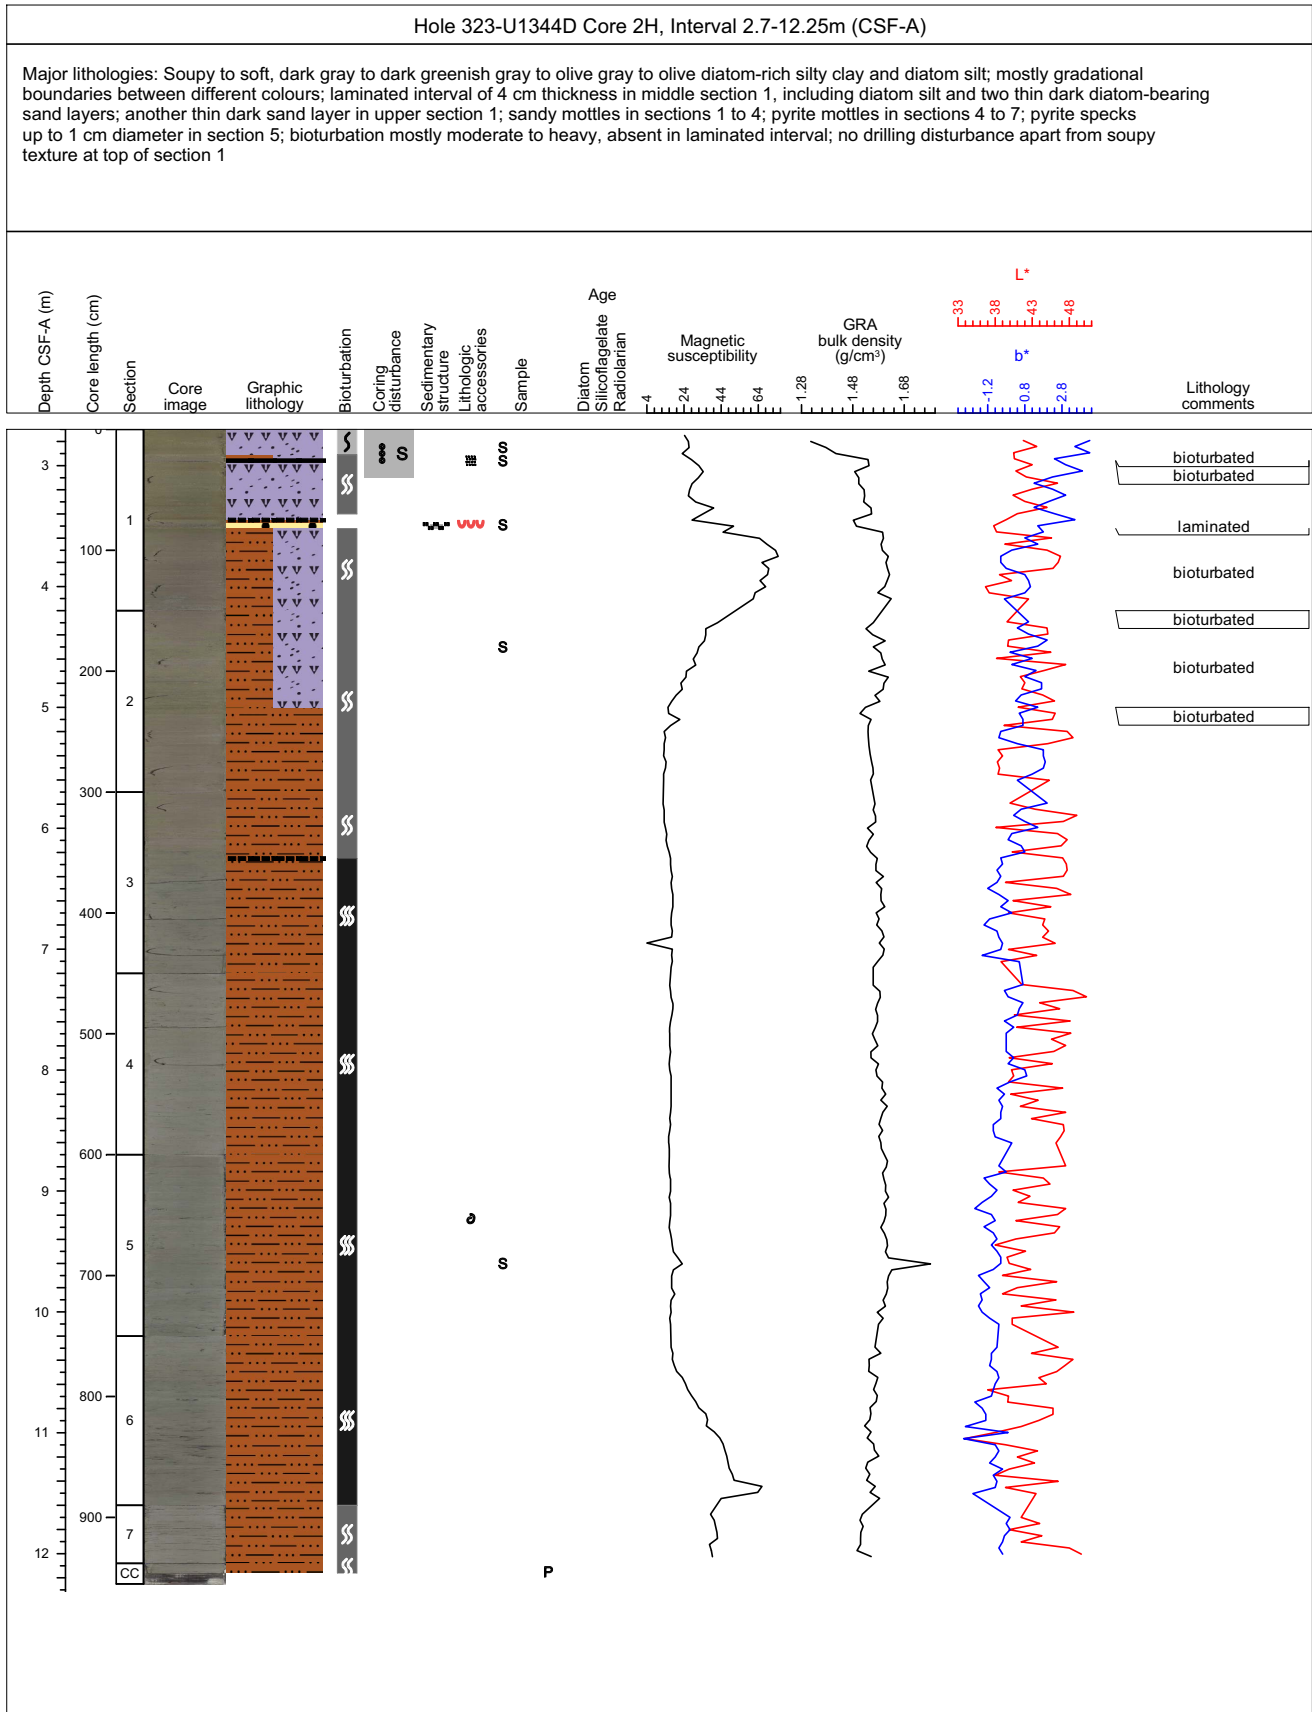

Major lithology: dark olive diatom ooze. Secondary lithology: greenish black sand. The upper and lower contacts on the sand layer are very sharp. Bioturbation is slight throughout the core, mainly expressed as dark green or blue green mottles.

### Core Photo

### Core Photo

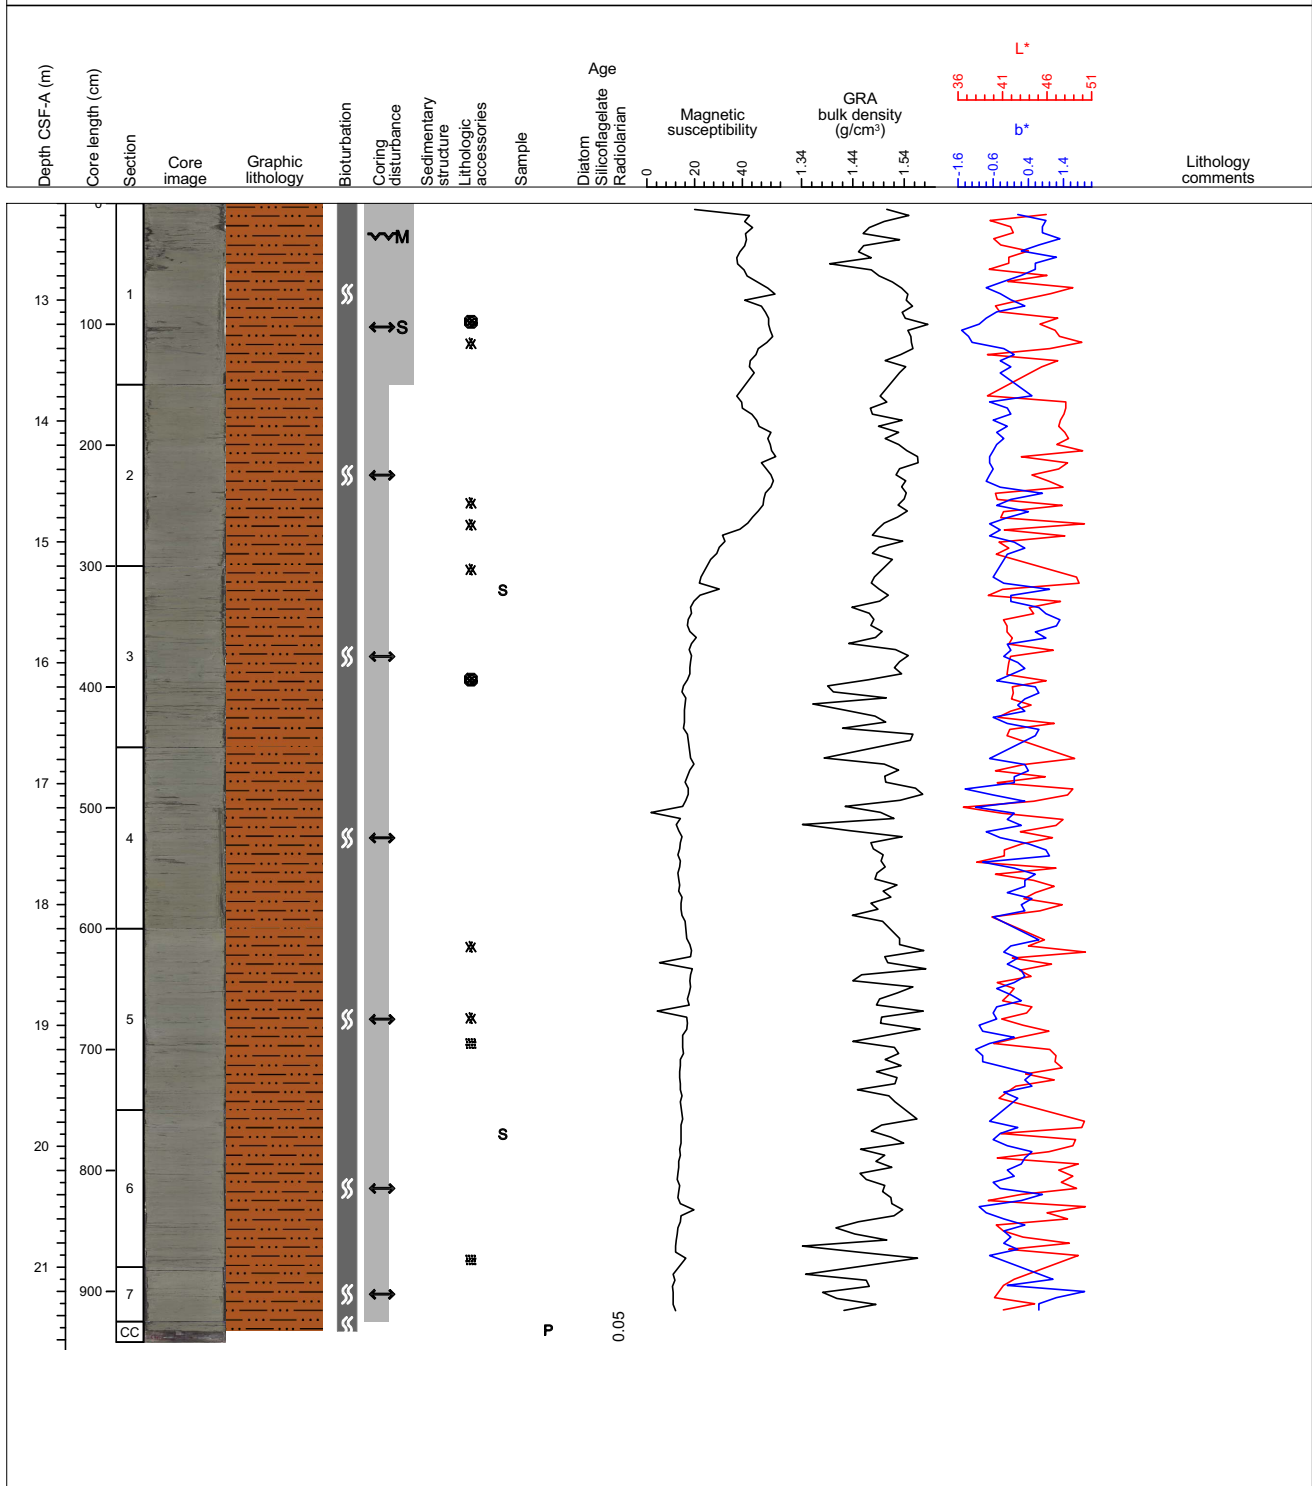

### Core Photo

Hole 323-U1344D Core 3H, Interval 12.2-21.62m (CSF-A)

Major lithologies: Soft, dark greenish gray diatom-rich silty clay; pyrite mottles in sections 1 and 2; small pebbles in sections 1 and 2; sandy layers and mottles in sections 1, 5 and 6; sponge spicule aggregates occur throughout most of the core; moderate bioturbation; slight gas expansion, moderate at top of section 1

### Core Photo

Hole 323-U1344D Core 4H, Interval 21.7-31.67m (CSF-A)

Major lithology: clay (dark greenish gray 10GY 4/1). A large skolithos ichnofossil occurred in Section 7 (26-70cm). Green colored consolidated clay fills the burrow. A large mottling with sand occurred in Section 4 (46-50cm). Bioturbation is slight to moderate.

### Core Photo

Hole 323-U1344D Core 5H, Interval 31.2-38.31m (CSF-A)

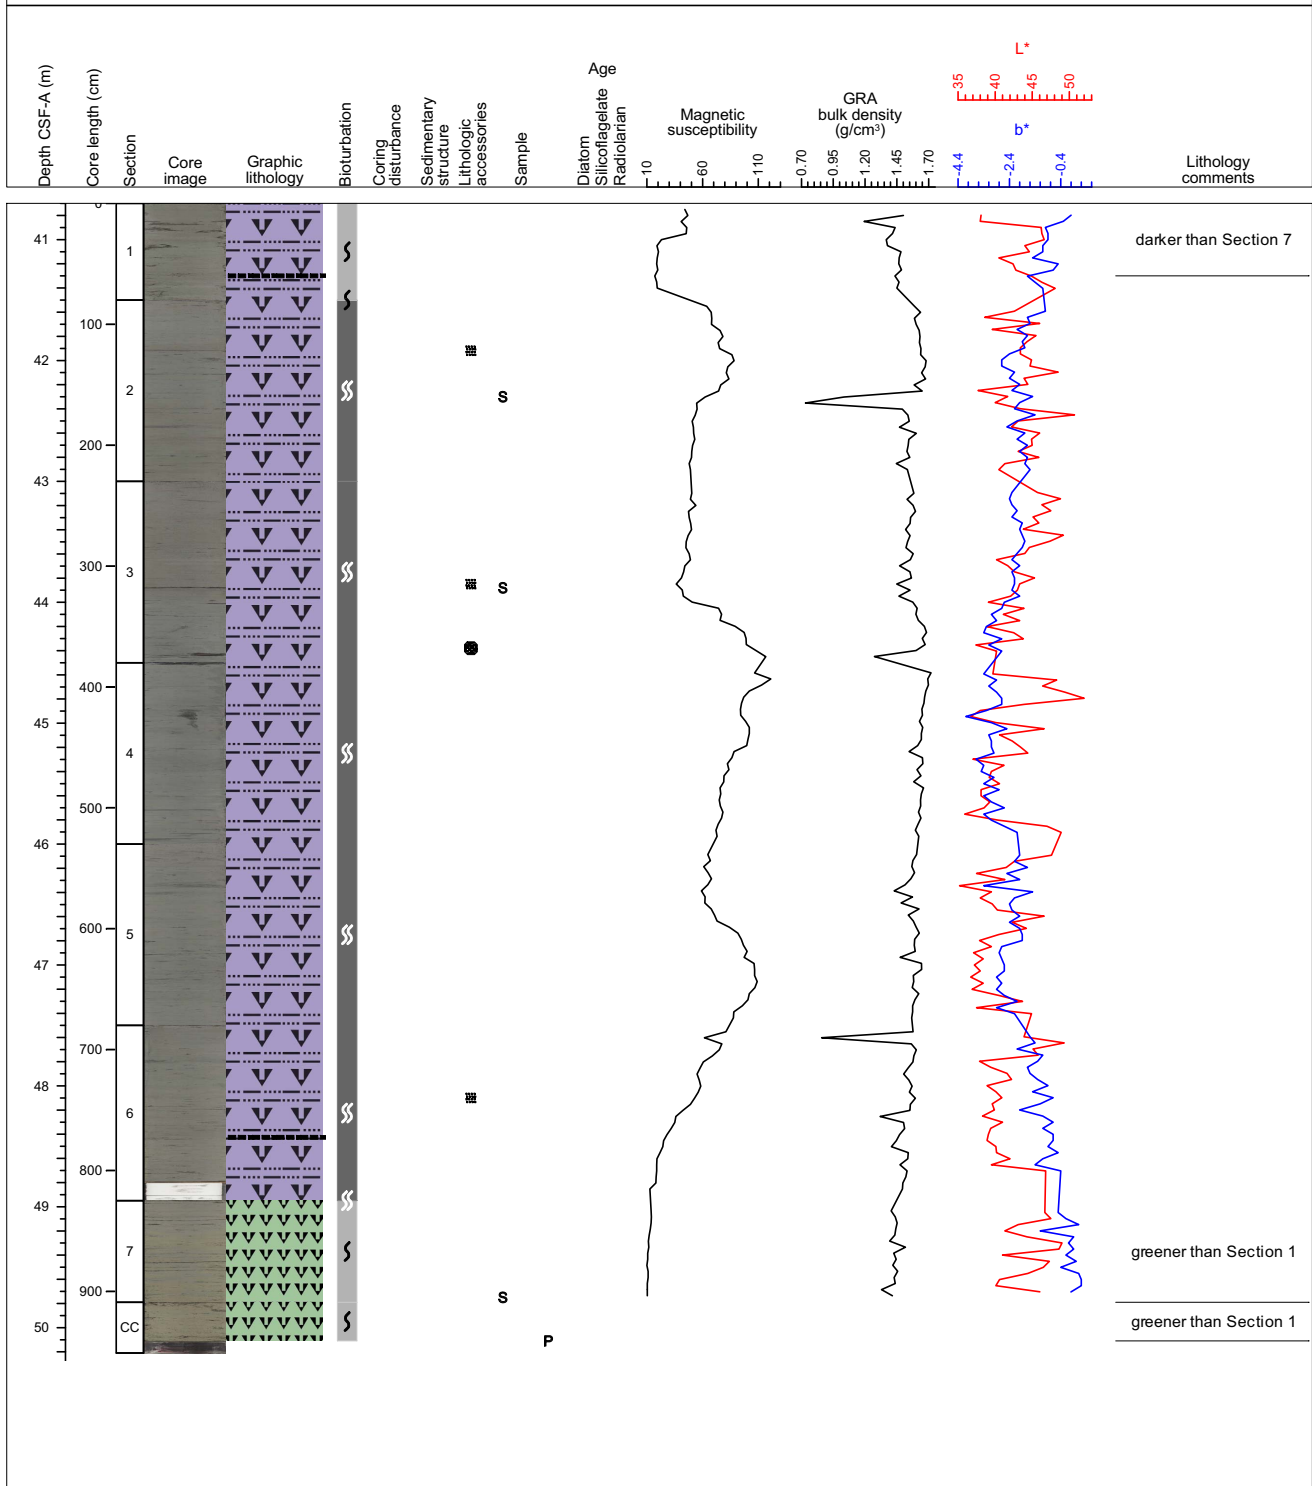

The main lithologies are dark greenish gray diatom-rich clayey silt (sections 1-4) and very dark greenish gray diatom-bearing clayey silt (sections 4-CC). A 60cm thick transition between the lithologies occurs in section 4. A sand layer is present in section 1 and a small pebble at the bottom of section 3. The core is mottled throughout by both dark (sulfide) and green mottles.

### Core Photo

Hole 323-U1344D Core 6H, Interval 40.7-50.21m (CSF-A)

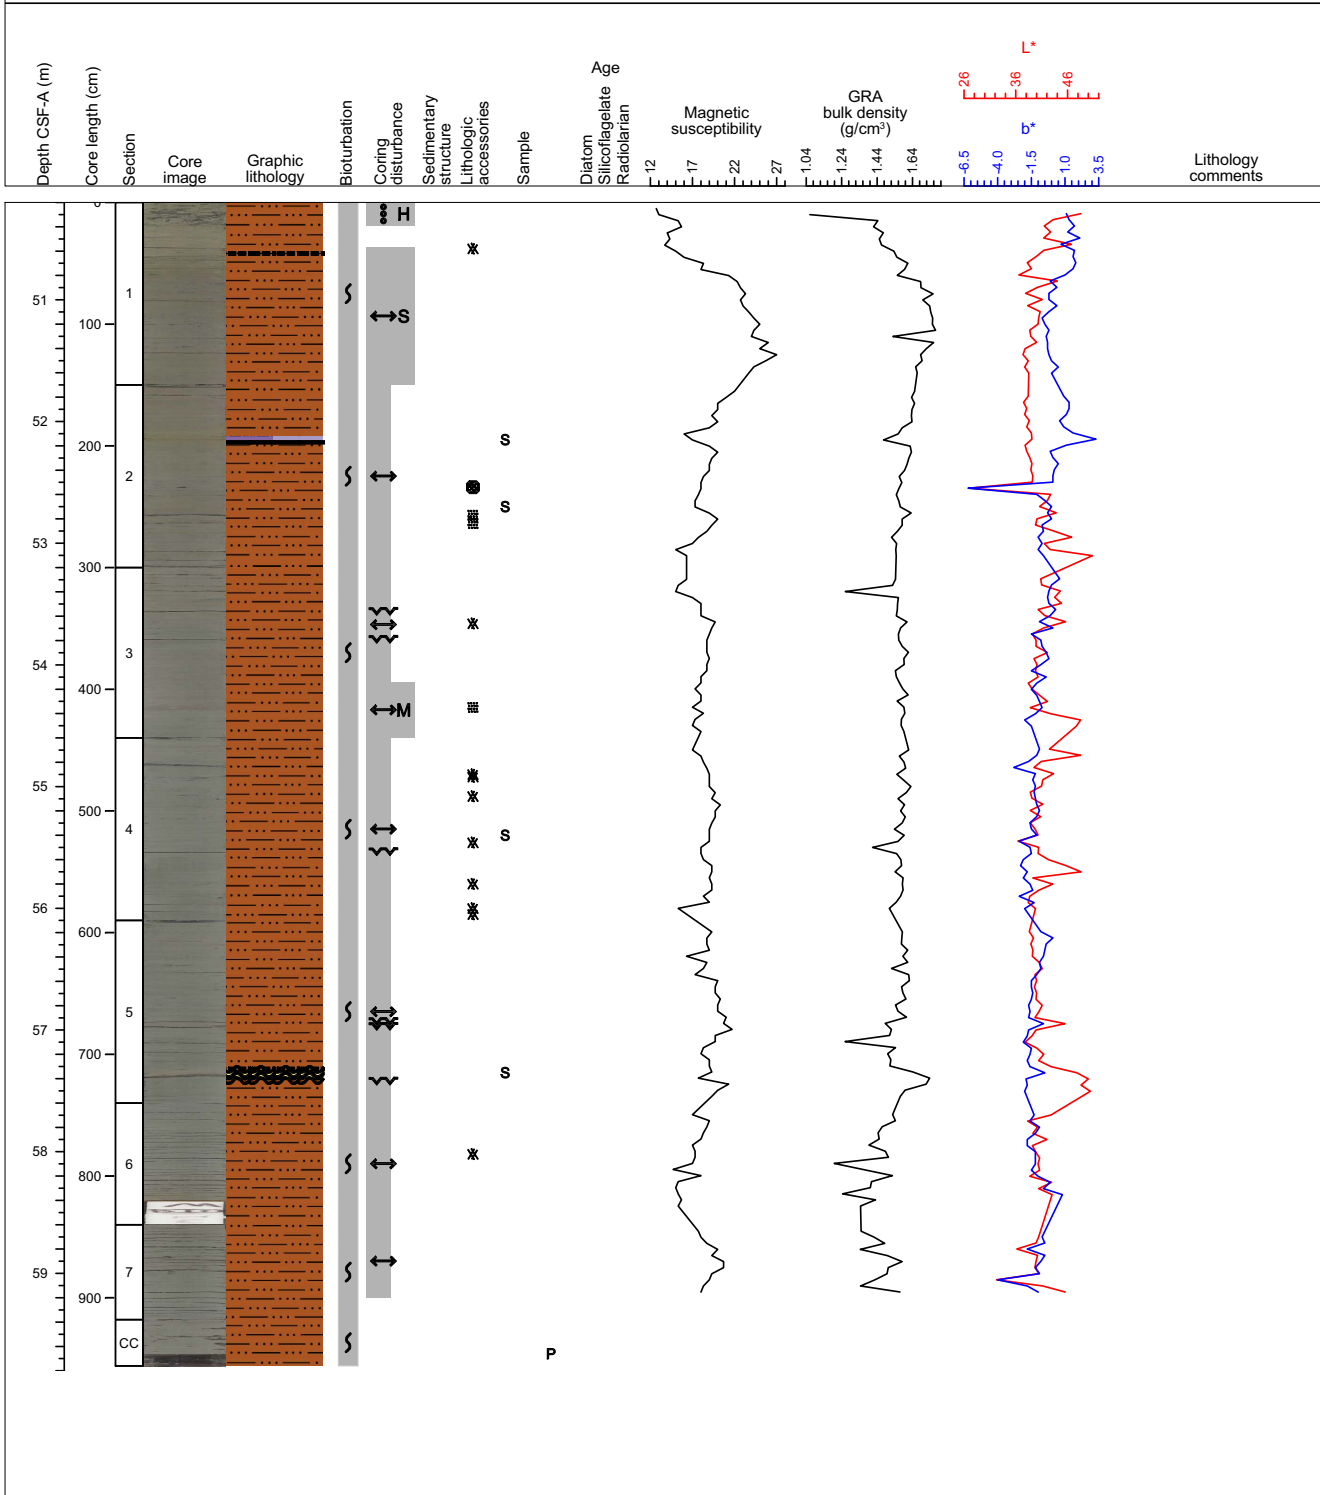

Major lithology: diatom clayey silt (dark greenish gray 10Y 4/1 to 5GY 4/1) from Section 1 to Section 6; diatom ooze (dark greenish gray 10Y 4/1). Green silty clay layer containing large amount of botryoidal pyrite occurred in Section 3 (83-84cm). Bioturbation is slight to moderate. Skolithos ichonofossil filled by green clay occurred in Section 4.

### Core Photo

Hole 323-U1344D Core 7H, Interval 50.2-59.76m (CSF-A)

Major lithology: very dark greenish gray diatom-rich silty clay. Secondary lithologies: olive gray foraminifer-bearing diatom silty clay, dark greenish gray authigenic carbonate- and diatom-rich clayey silt, and greenish black sand. The foram-bearing diatom silty clay has a sharp lower boundary and the sand layer has sharp, tilted upper and lower boundaries. Bioturbation is slight throughout the core with many chondrites burrows filled with an assortment of sediments. A clast occurred in section 2. Disturbance is slight to moderate due to gas expansion. The upper 19 cm of section 1 was extruded onto the rig floor.

### Core Photo

Hole 323-U1344D Core 8H, Interval 59.7-66.51m (CSF-A)

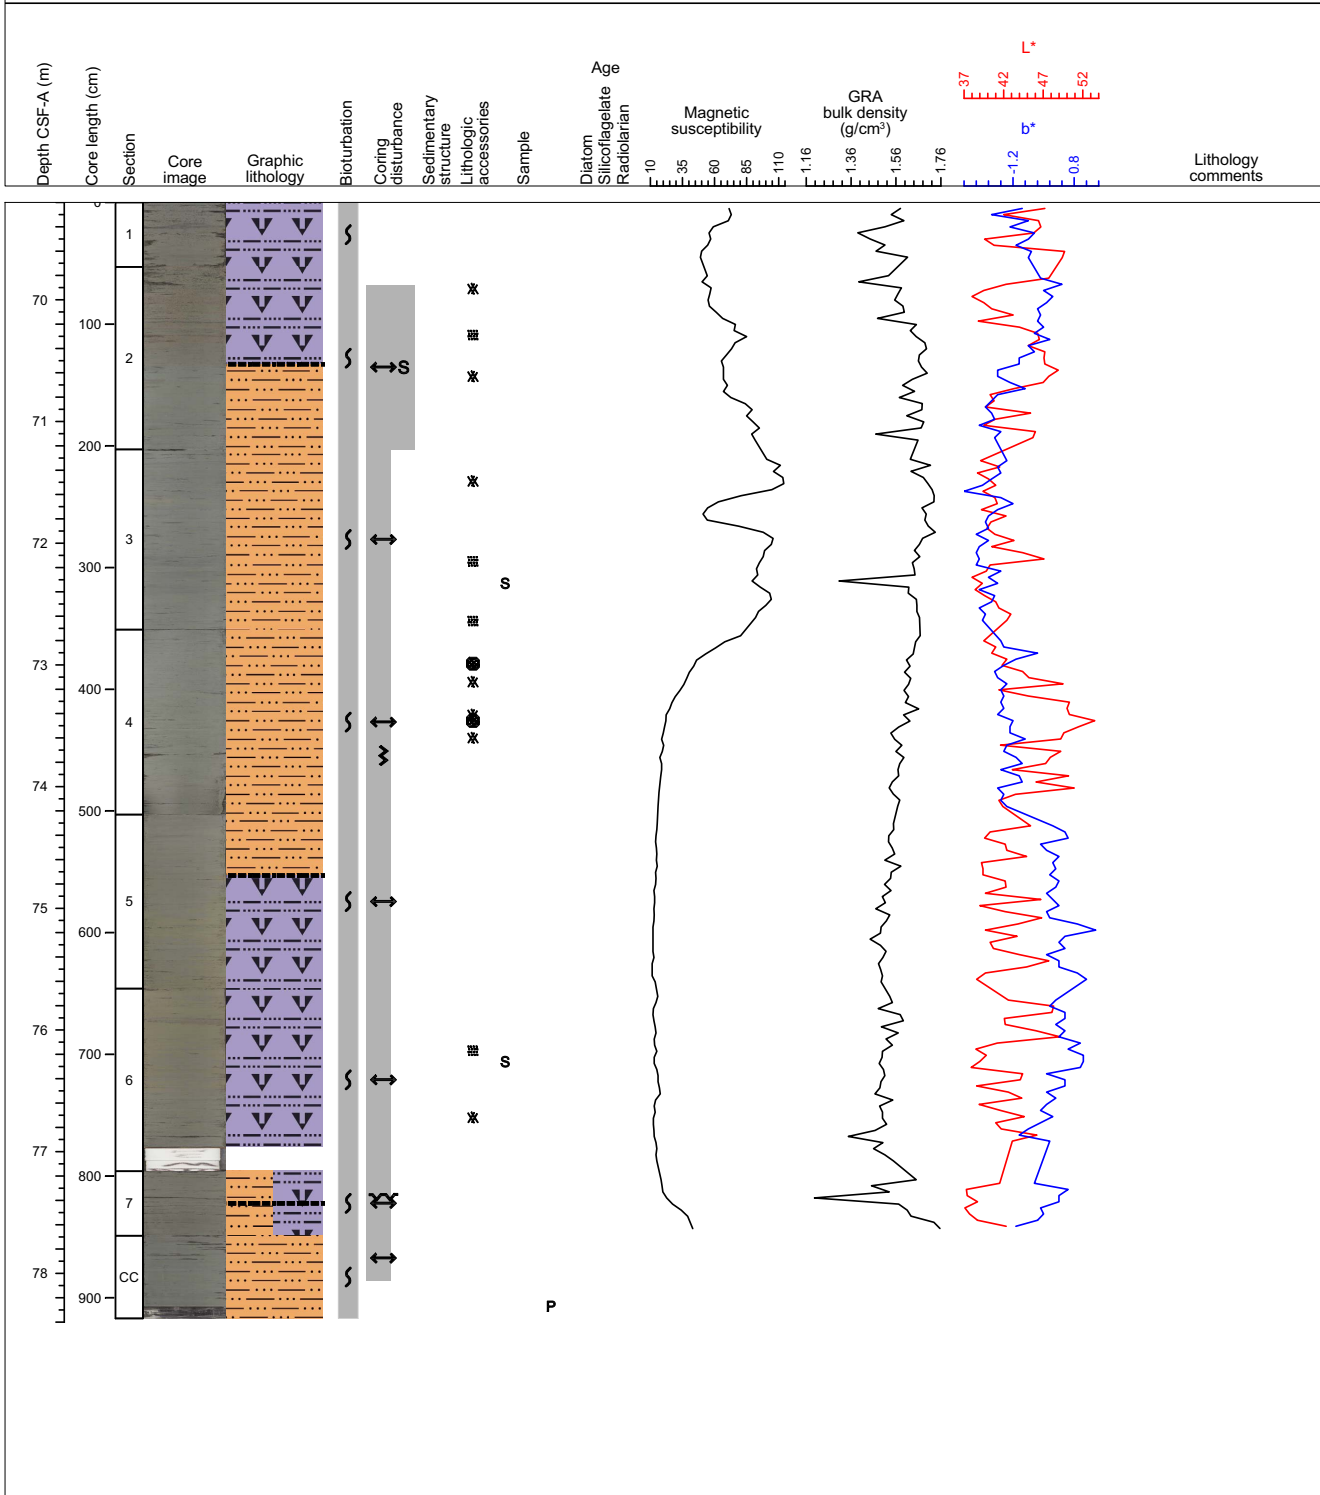

The lithology is very dark greenish gray diatom-bearing clayey silt. Several lighter patches occur throughout the core and they are characterized by abundant microcrystalline acicular authigenic carbonates. A greenish gray dolomite layer occurs on top of section 3. Several sandy mottles were observed in section 4. Sulfide specks and mottles occur scattered throughout the core.

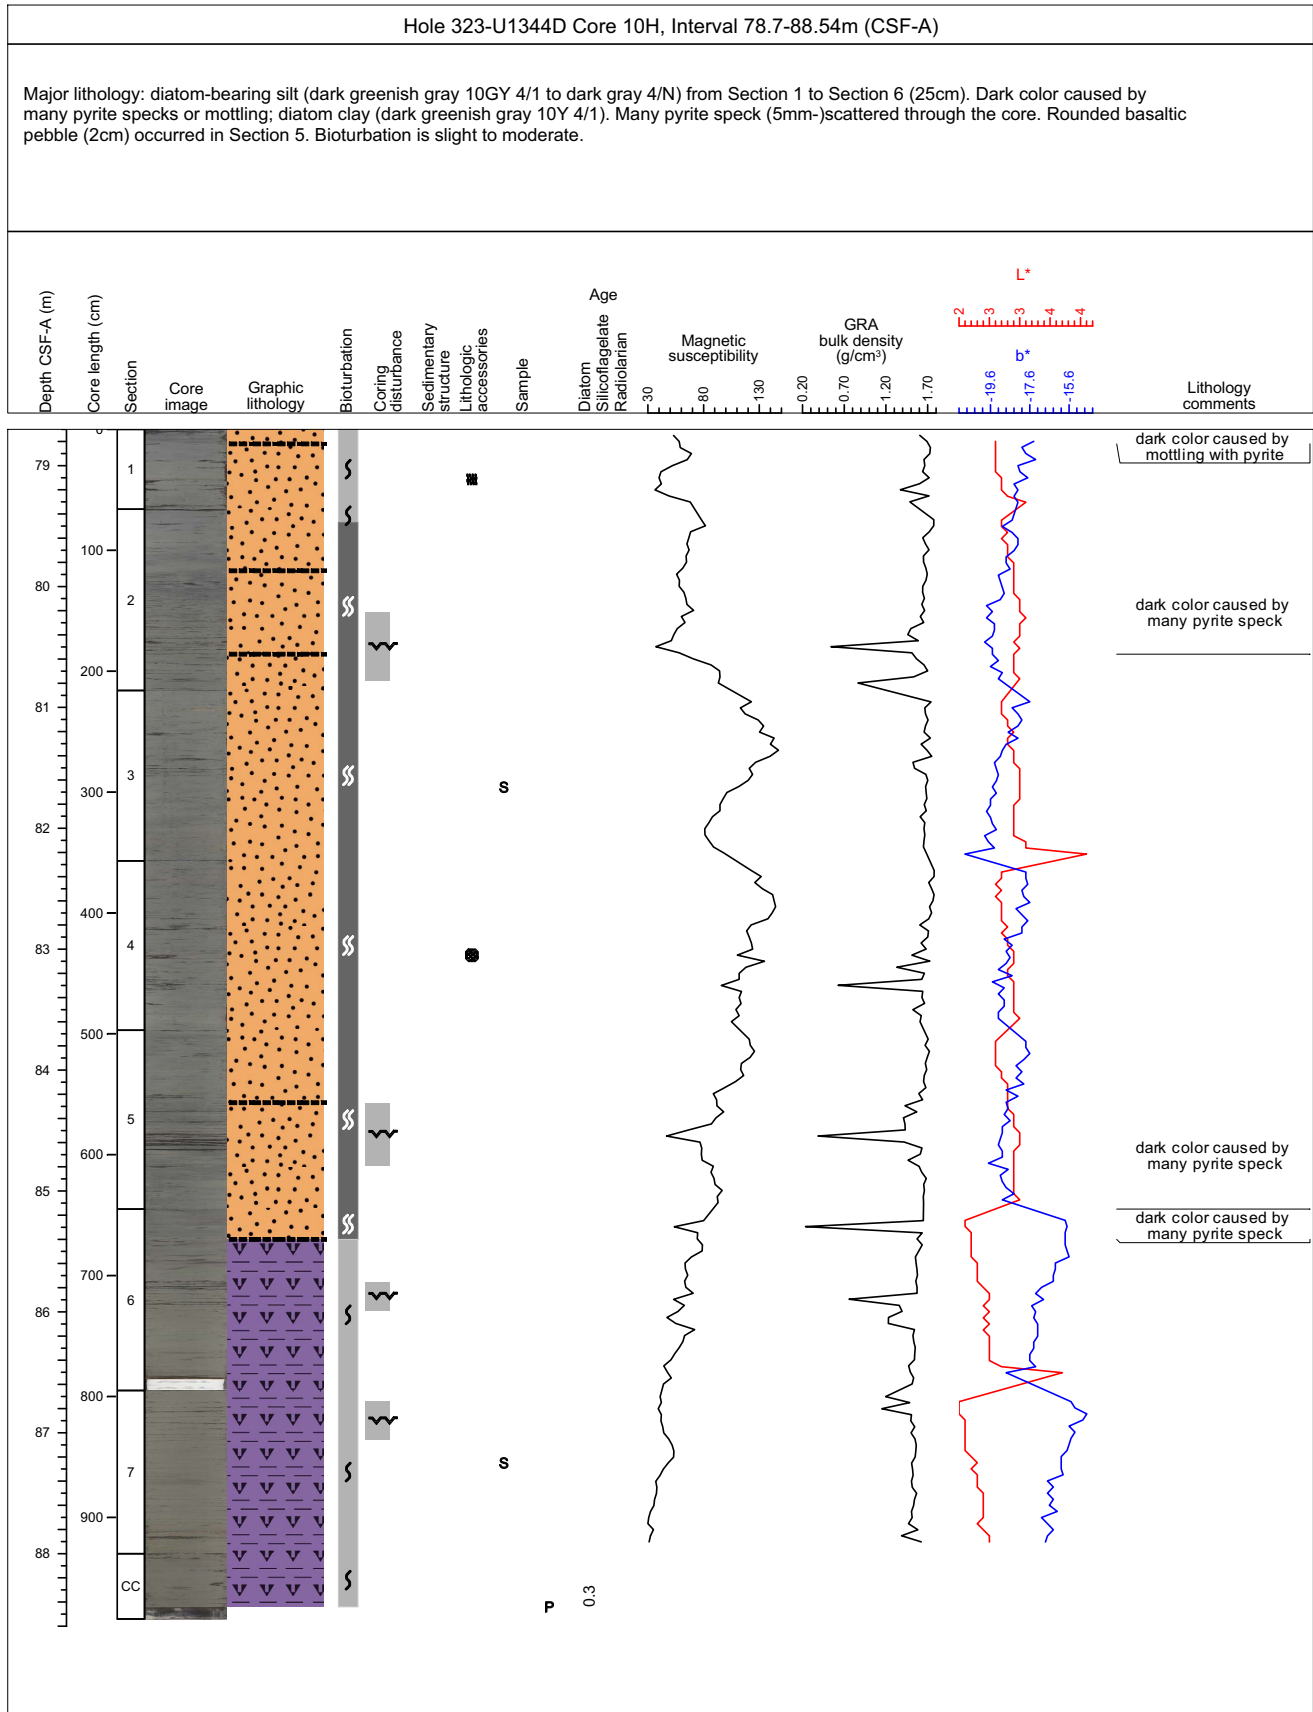

### Core Photo

Hole 323-U1344D Core 9H, Interval 69.2-78.37m (CSF-A)

Major lithologies: dark greenish gray diatom clayey silt and greenish black diatom-rich clayey silt. All boundaries are gradational. Bioturbation is slight throughout with mottles of sand, dark green clayey sediment, and light colored sediment. Drilling disturbance is slight due to gas expansion; however, section 1 was extruded onto the rig floor.

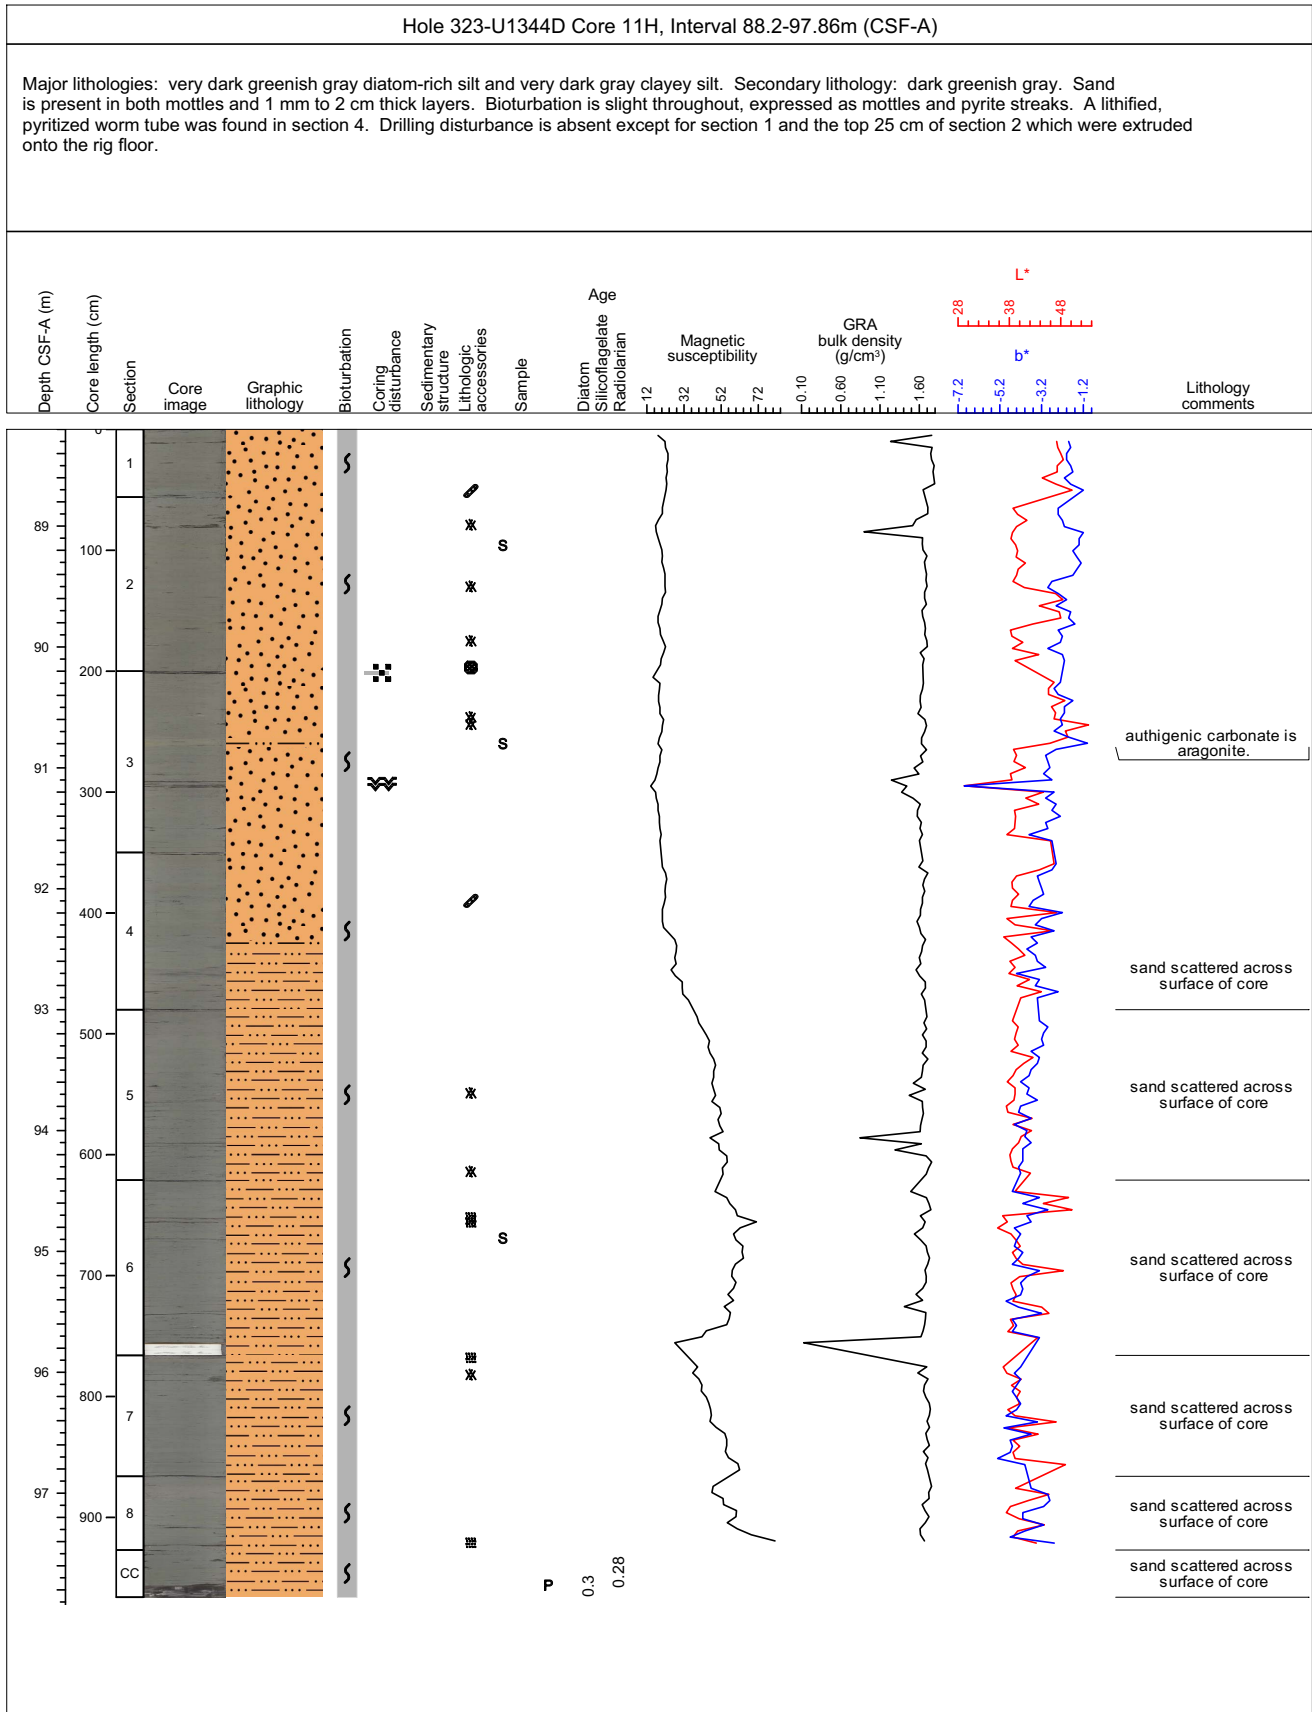

### Core Photo

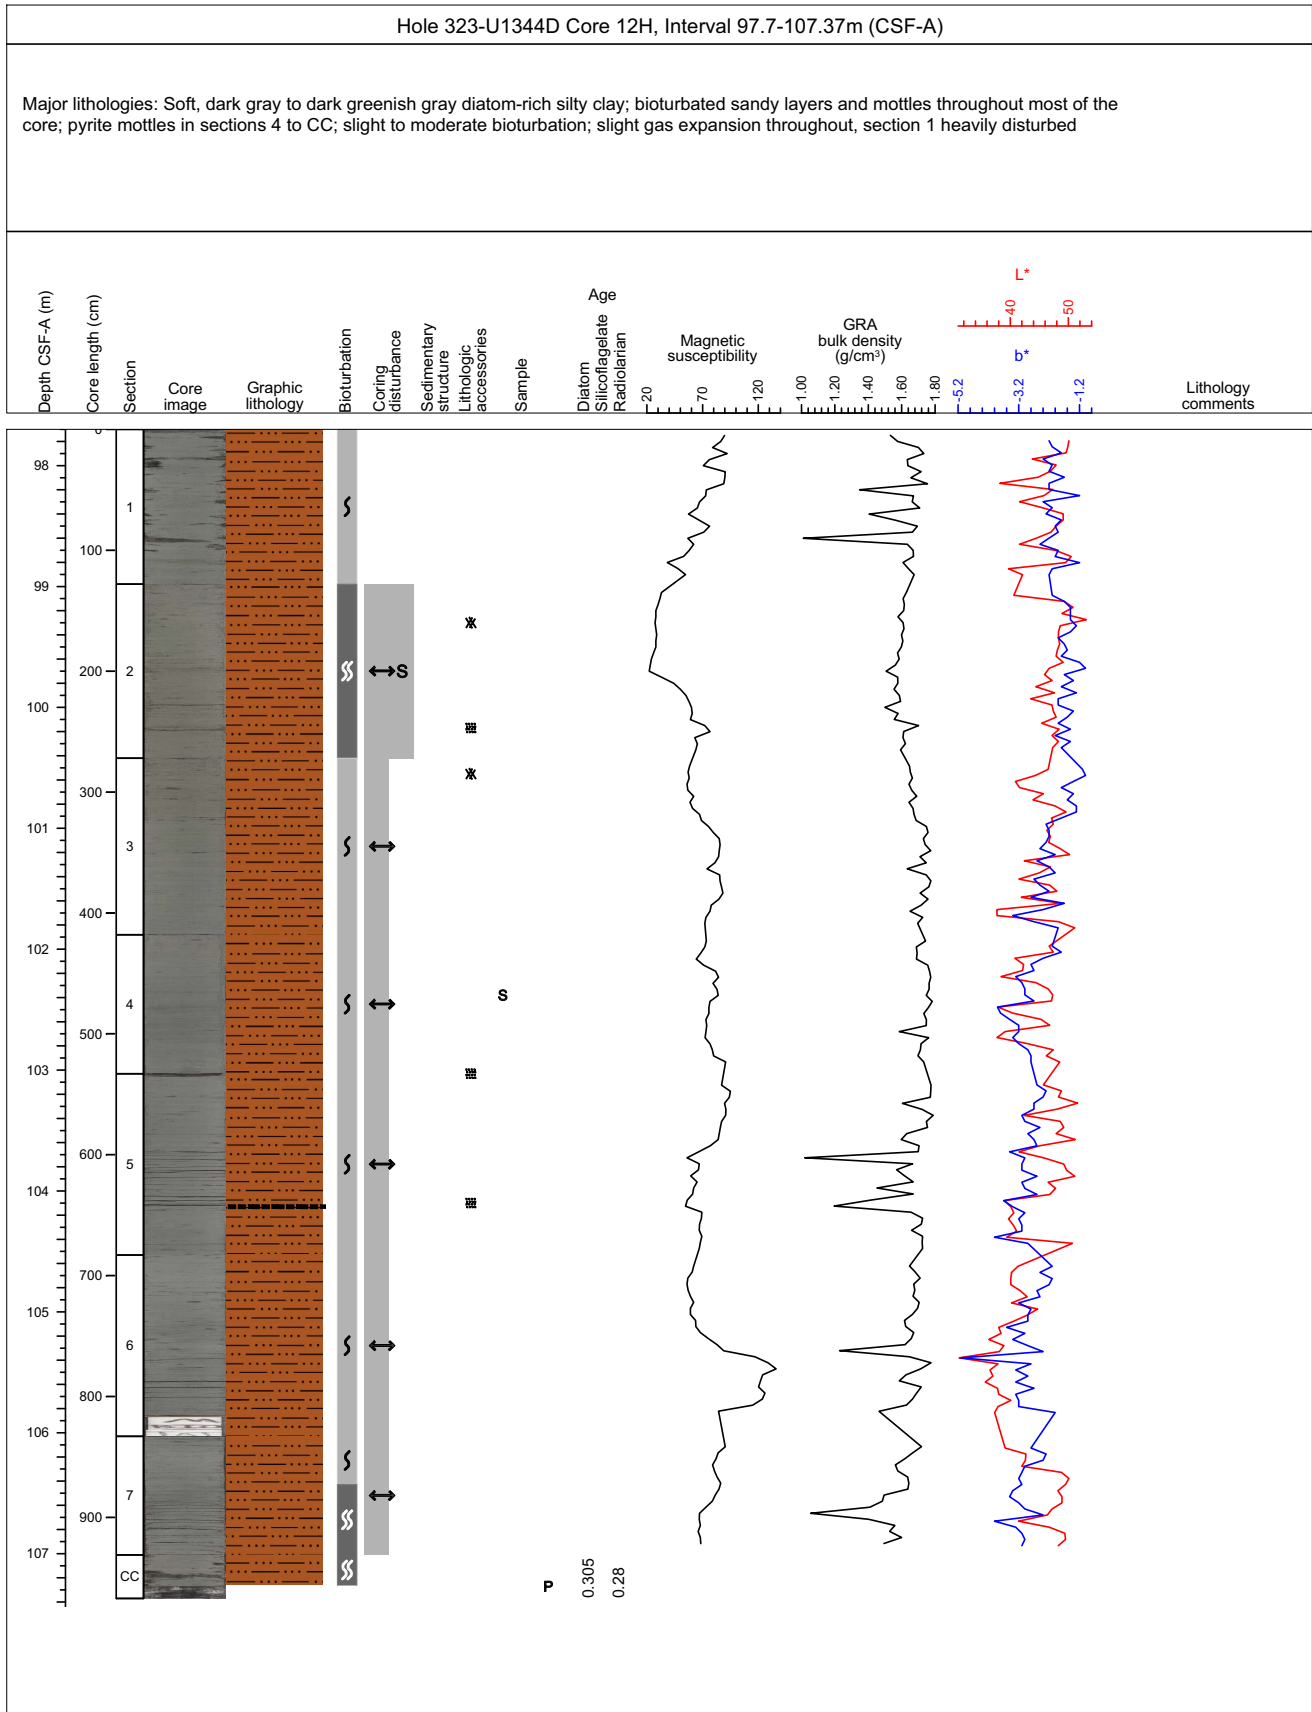

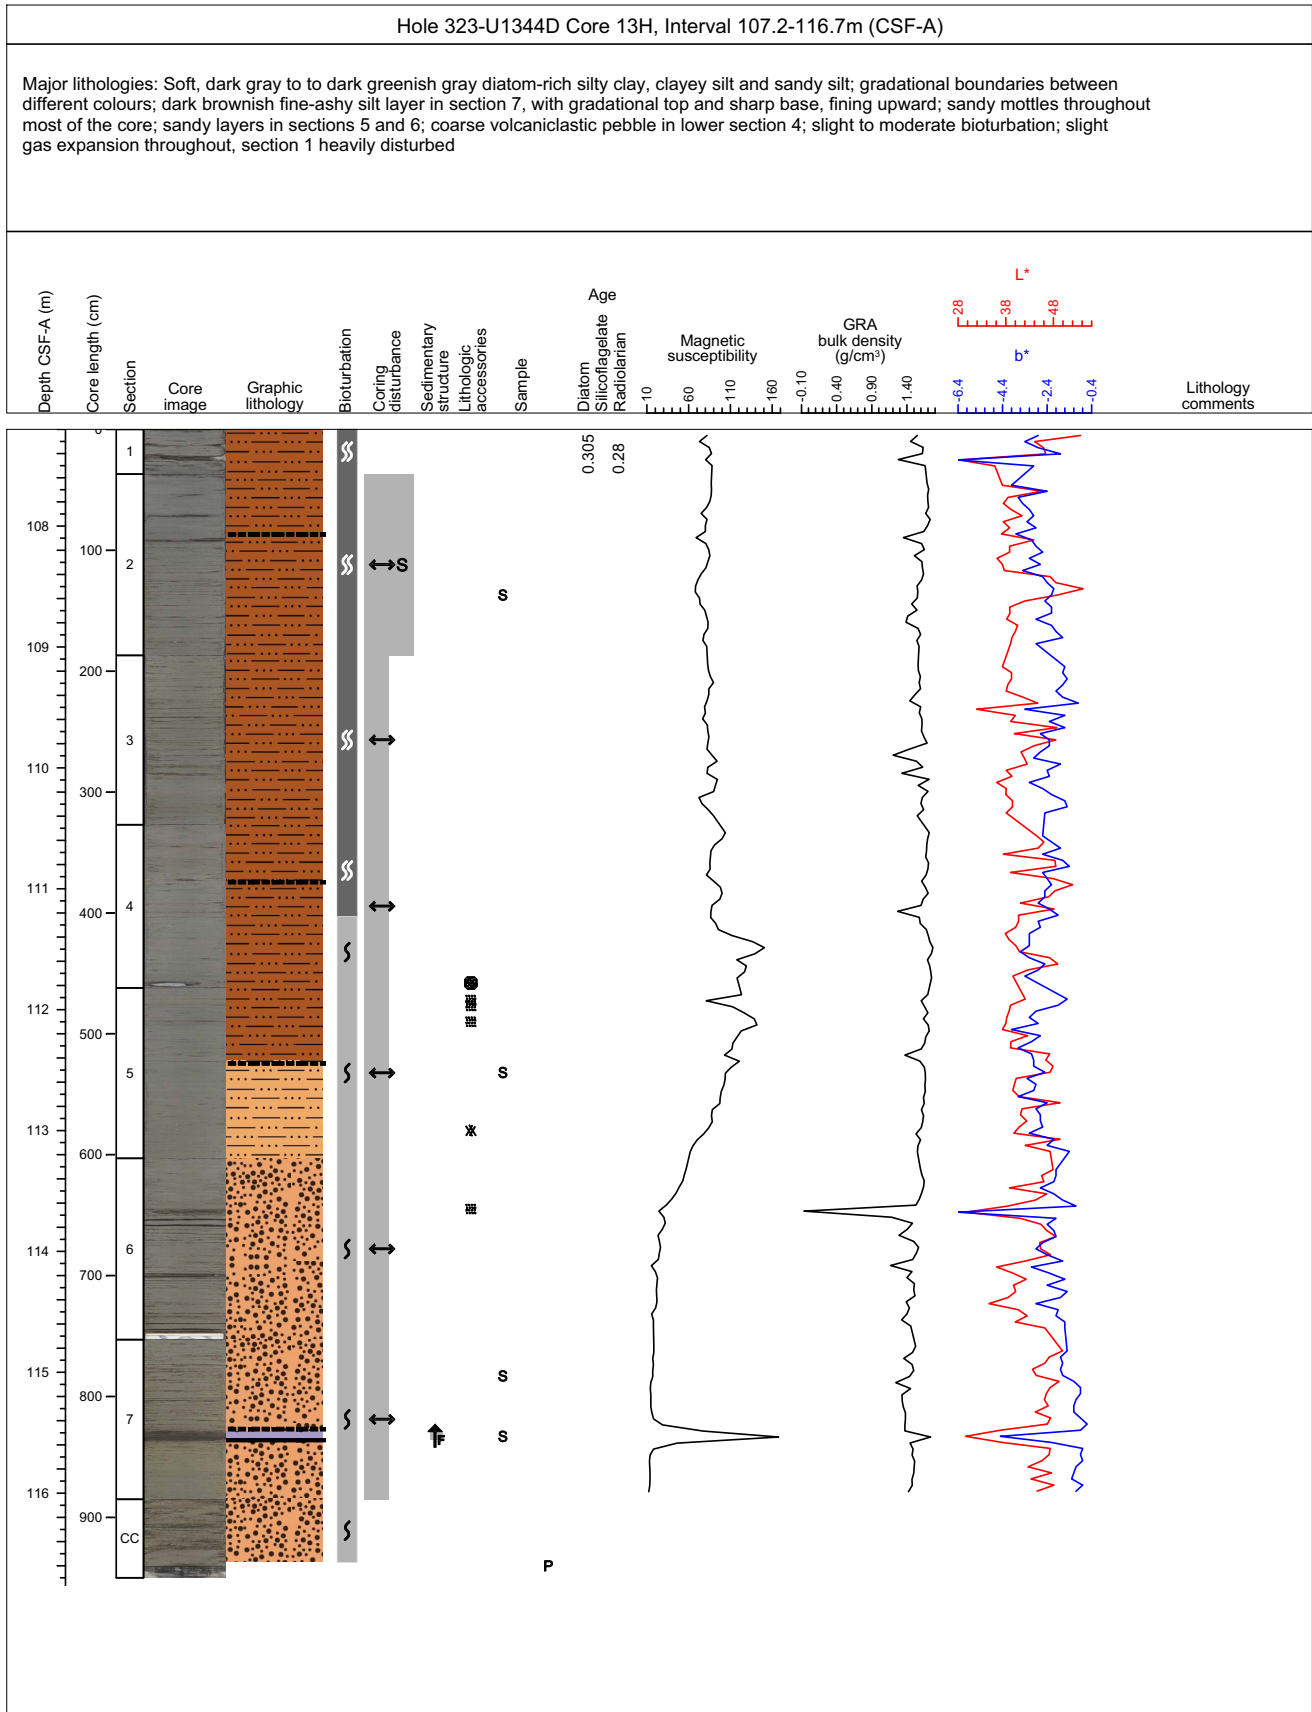

### Core Photo

### Core Photo

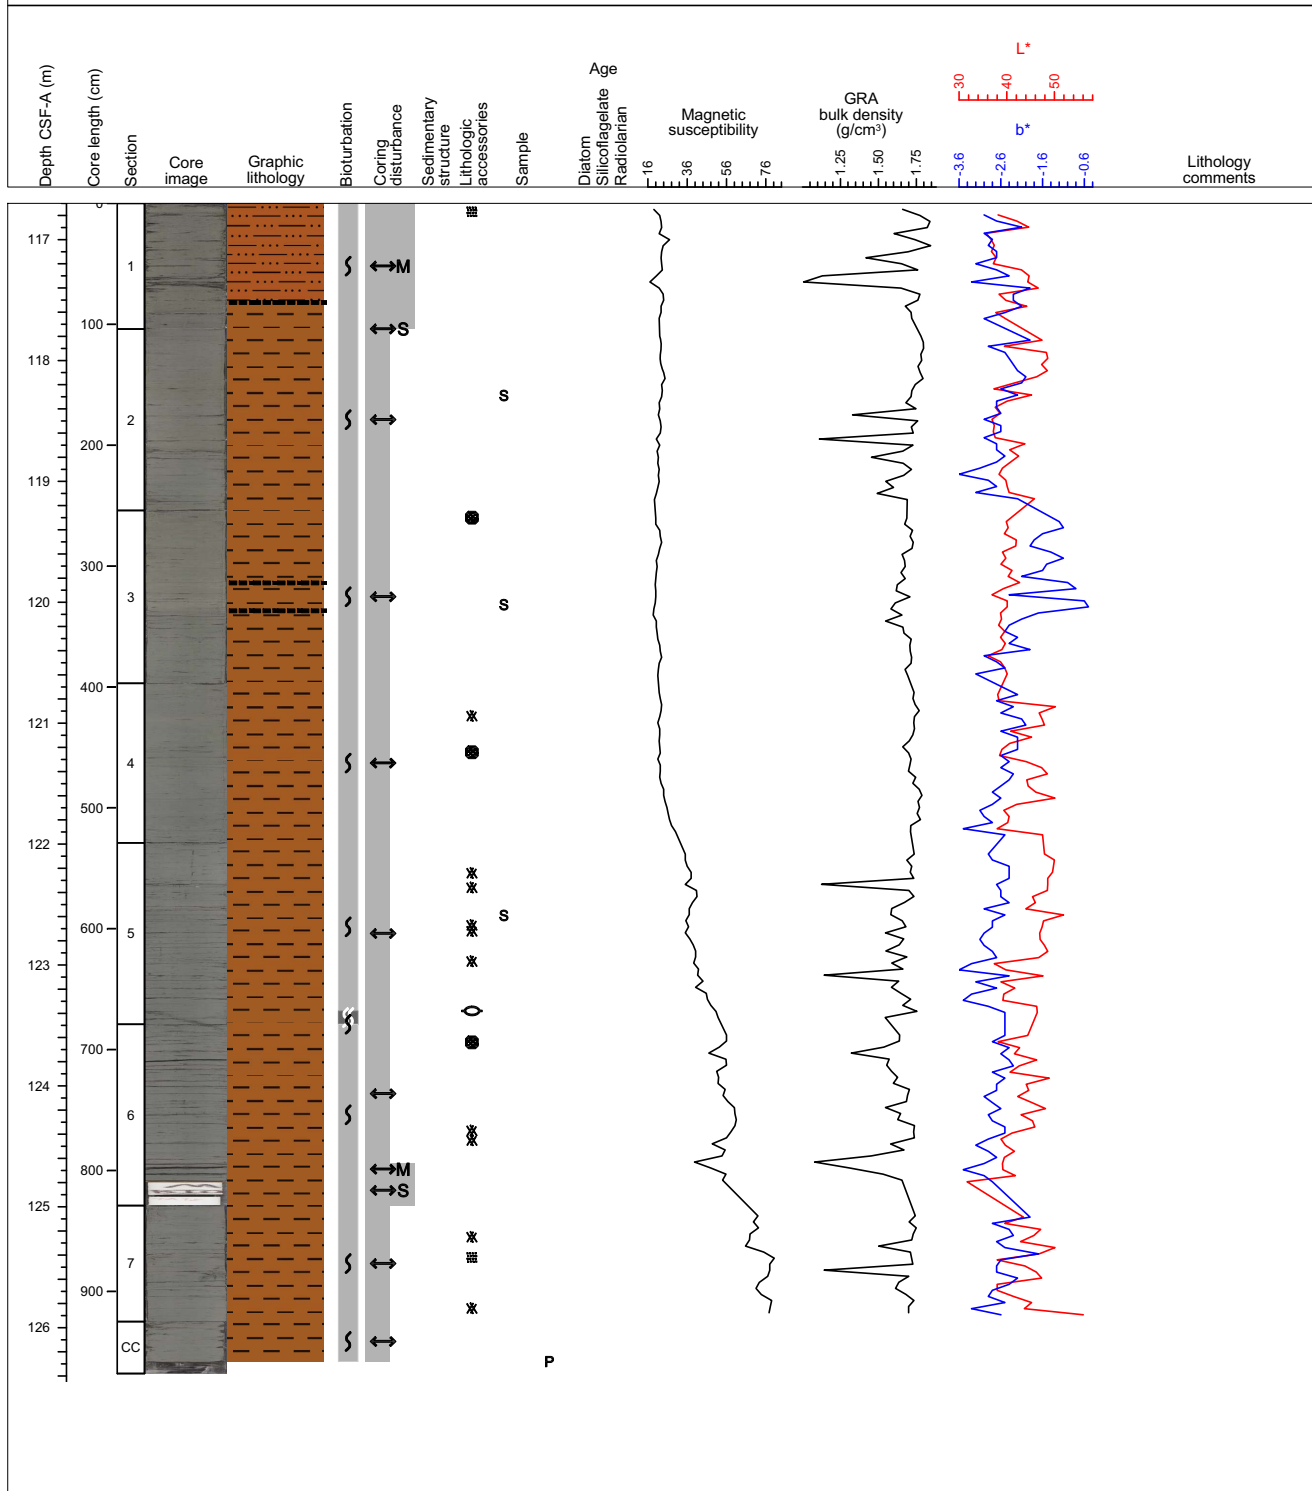

### Core Photo

### Core Photo

Hole 323-U1344D Core 14H, Interval 116.7-126.38m (CSF-A)

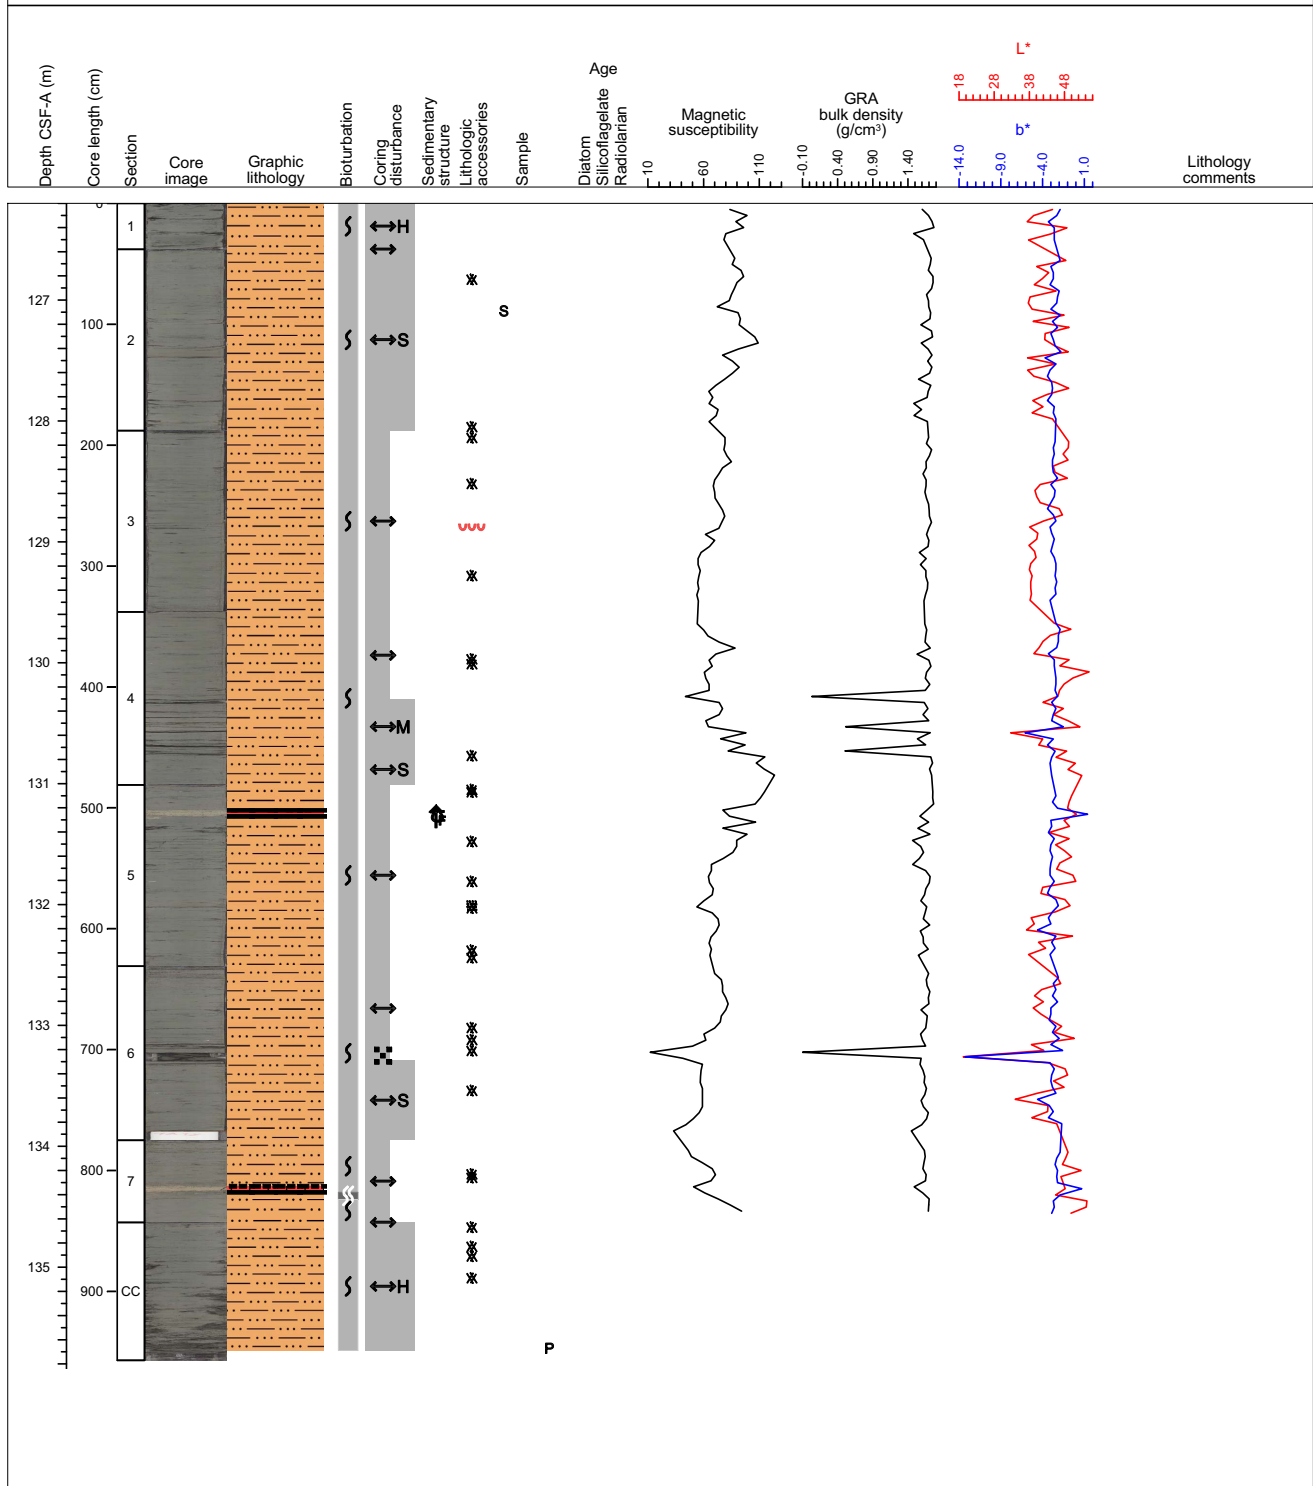

The main lithologies are very dark greenish grey diatom-bearing clay and diatom-bearing silty clay. There is an interval of authigenic carbonate-rich diatom-rich clay in section 3. All boundaries are gradational. There are streaky black mottles, sandy patches and occasional sponge spicules. Bioturbation is mostly slight and drilling disturbance is slight except in section 1.

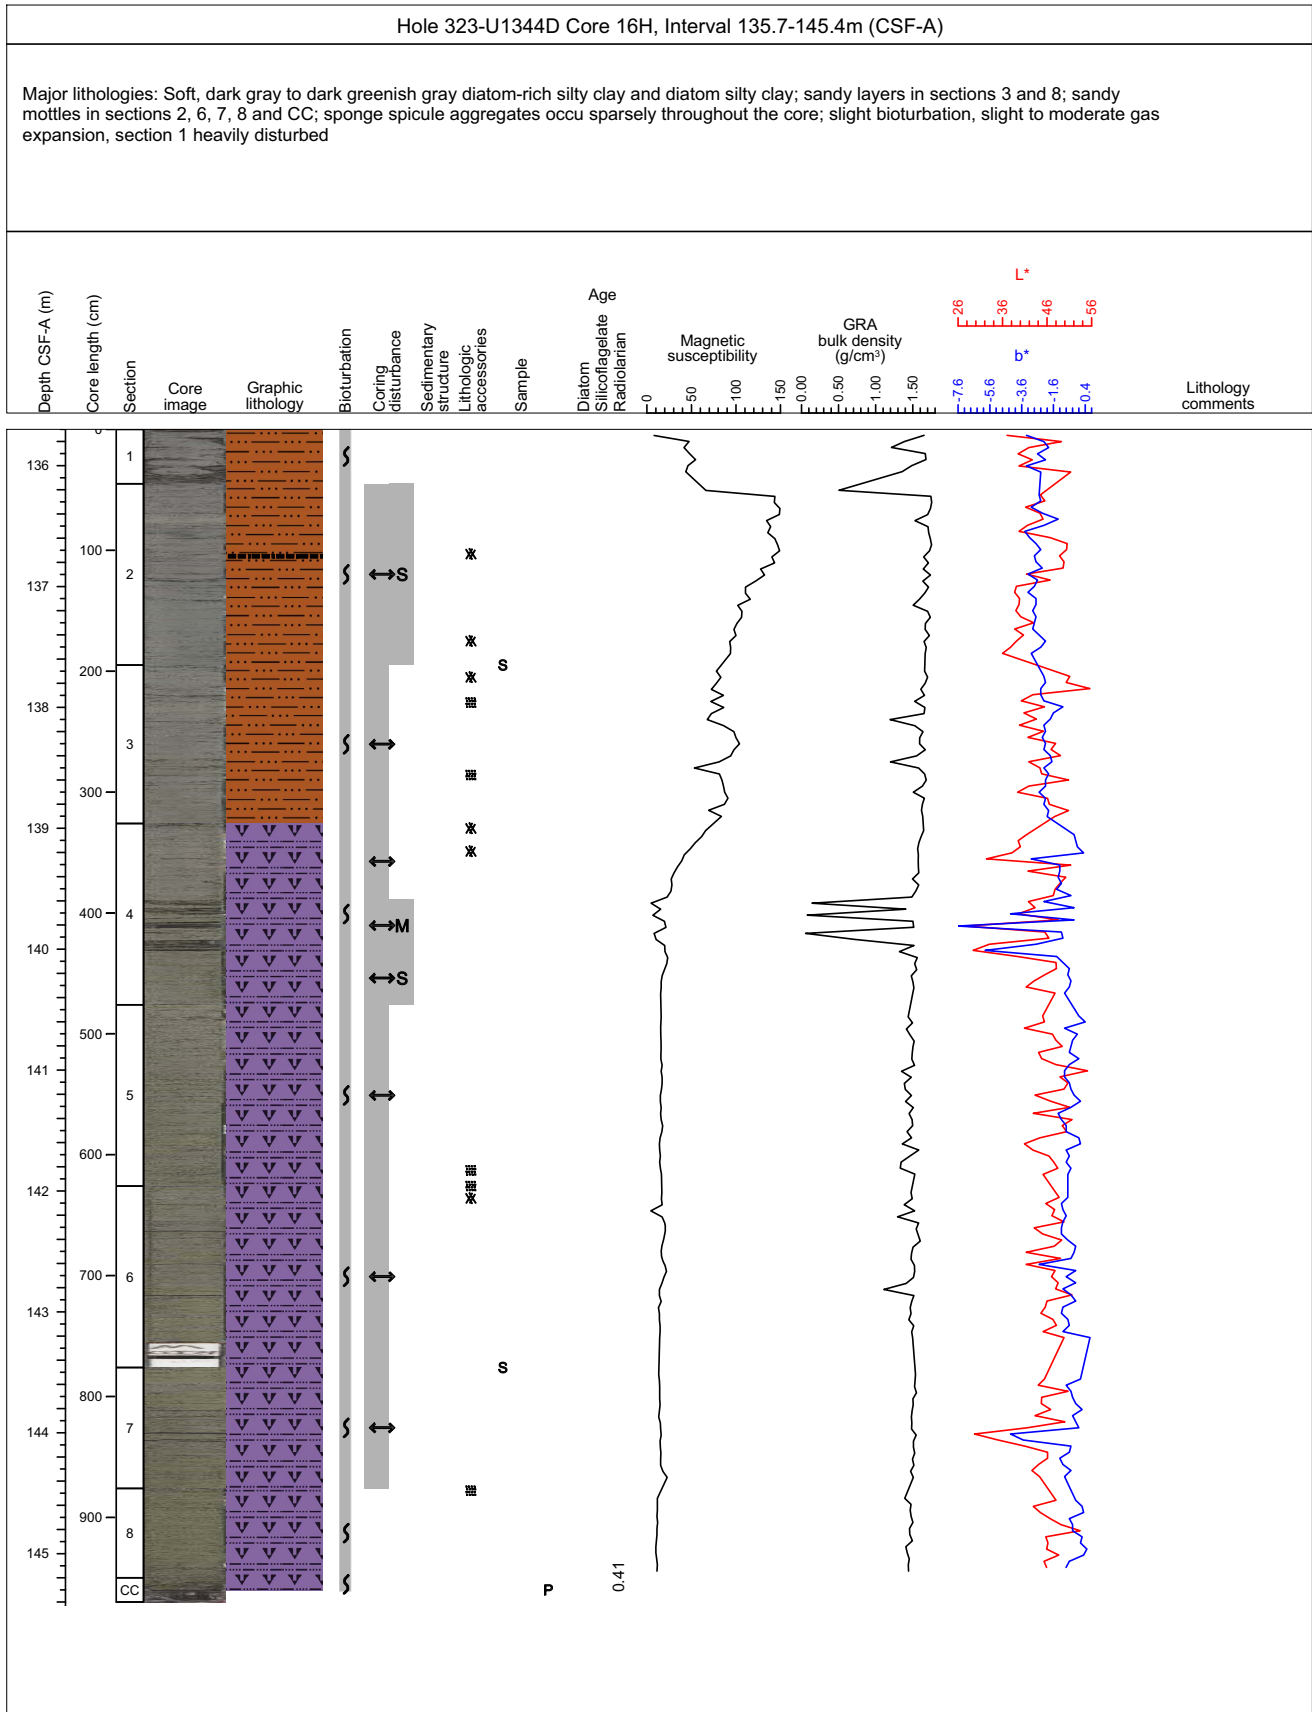

### Core Photo

Hole 323-U1344D Core 15H, Interval 126.2-135.77m (CSF-A)

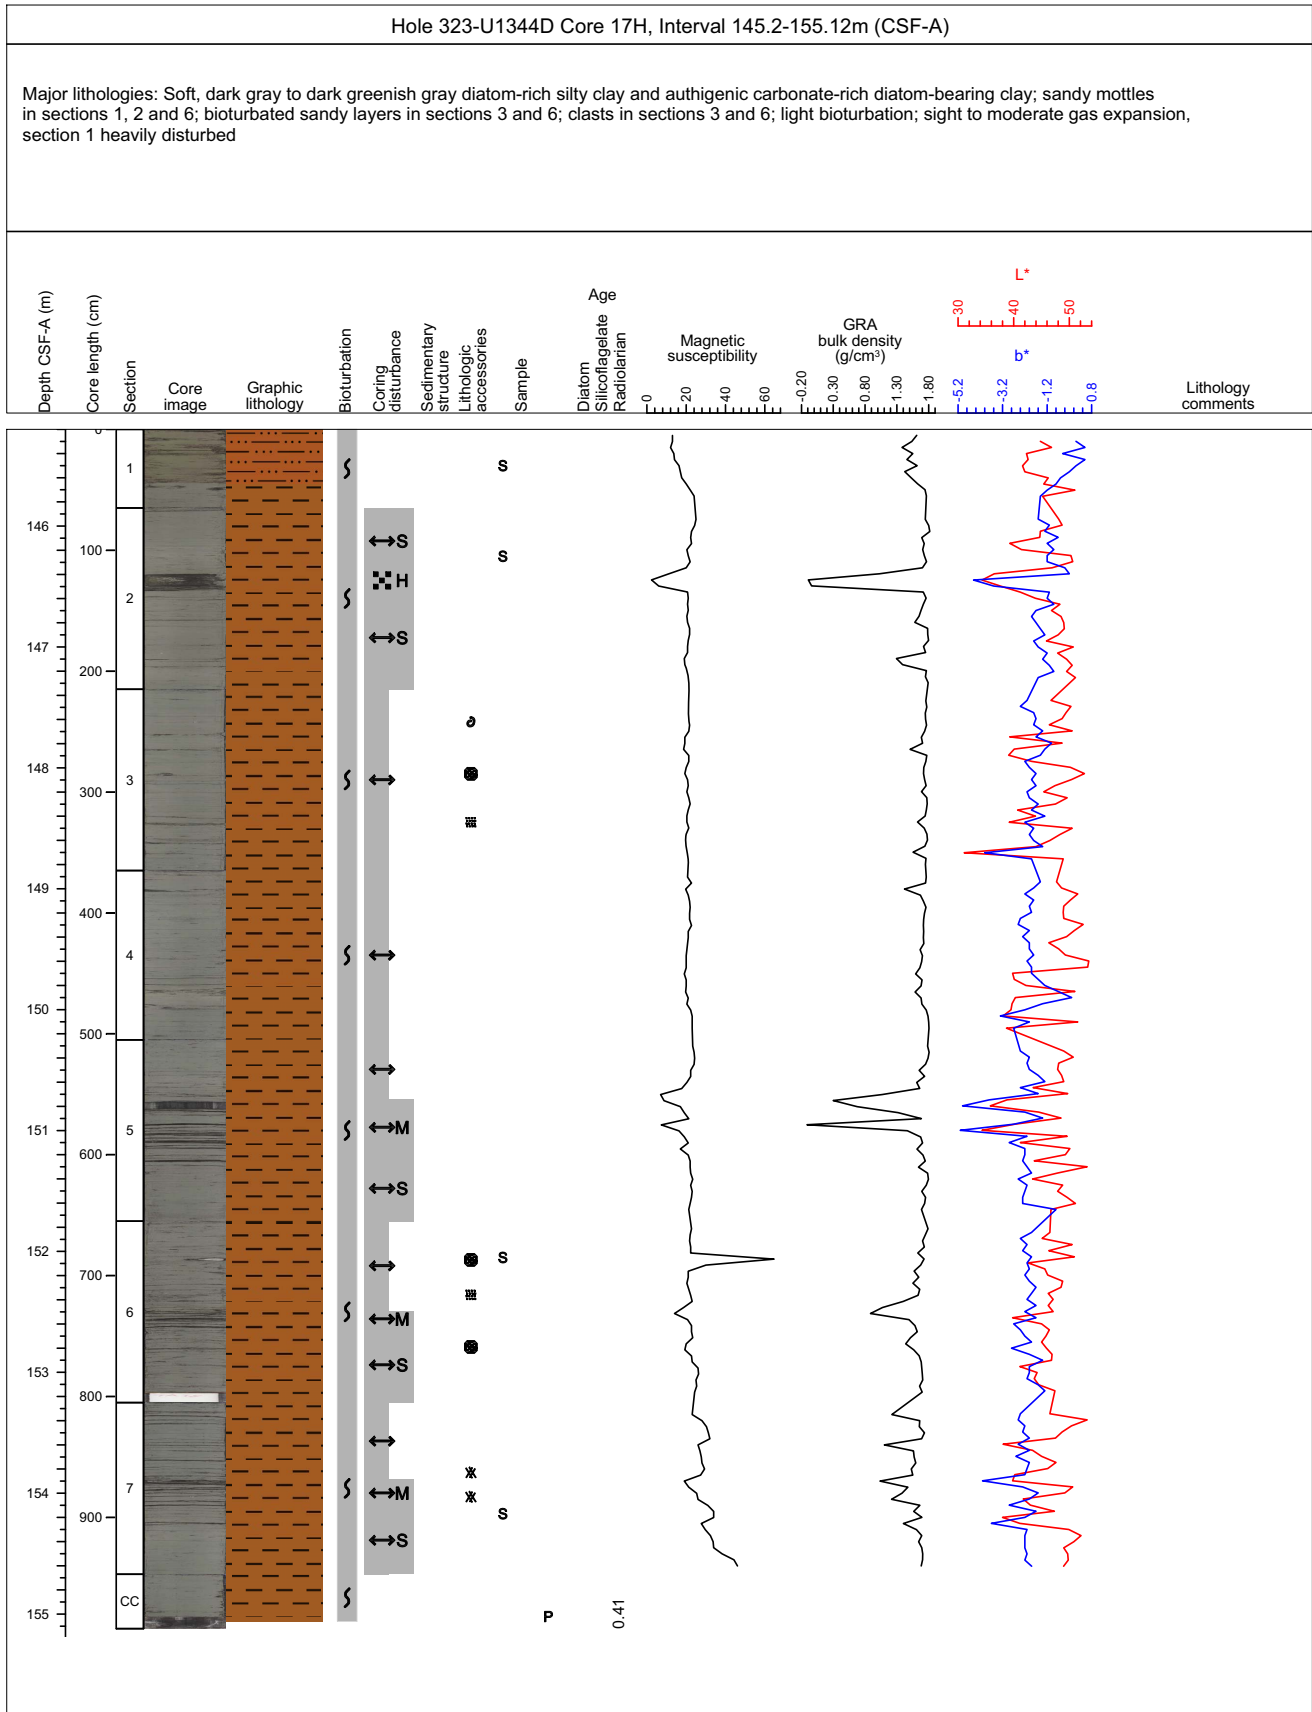

The main lithology is very dark greenish grey diatom-rich clayey silt. There are 5 cm thick olive grey fine ash layers in sections 5 and 7. There are black streaky mottles, sponge spicule aggregates, and sandy patches throughout the core. Bioturbation is mostly slight. Drilling disturbance is severe in section 1 and the core catcher due to gas expansion but mostly slight between.

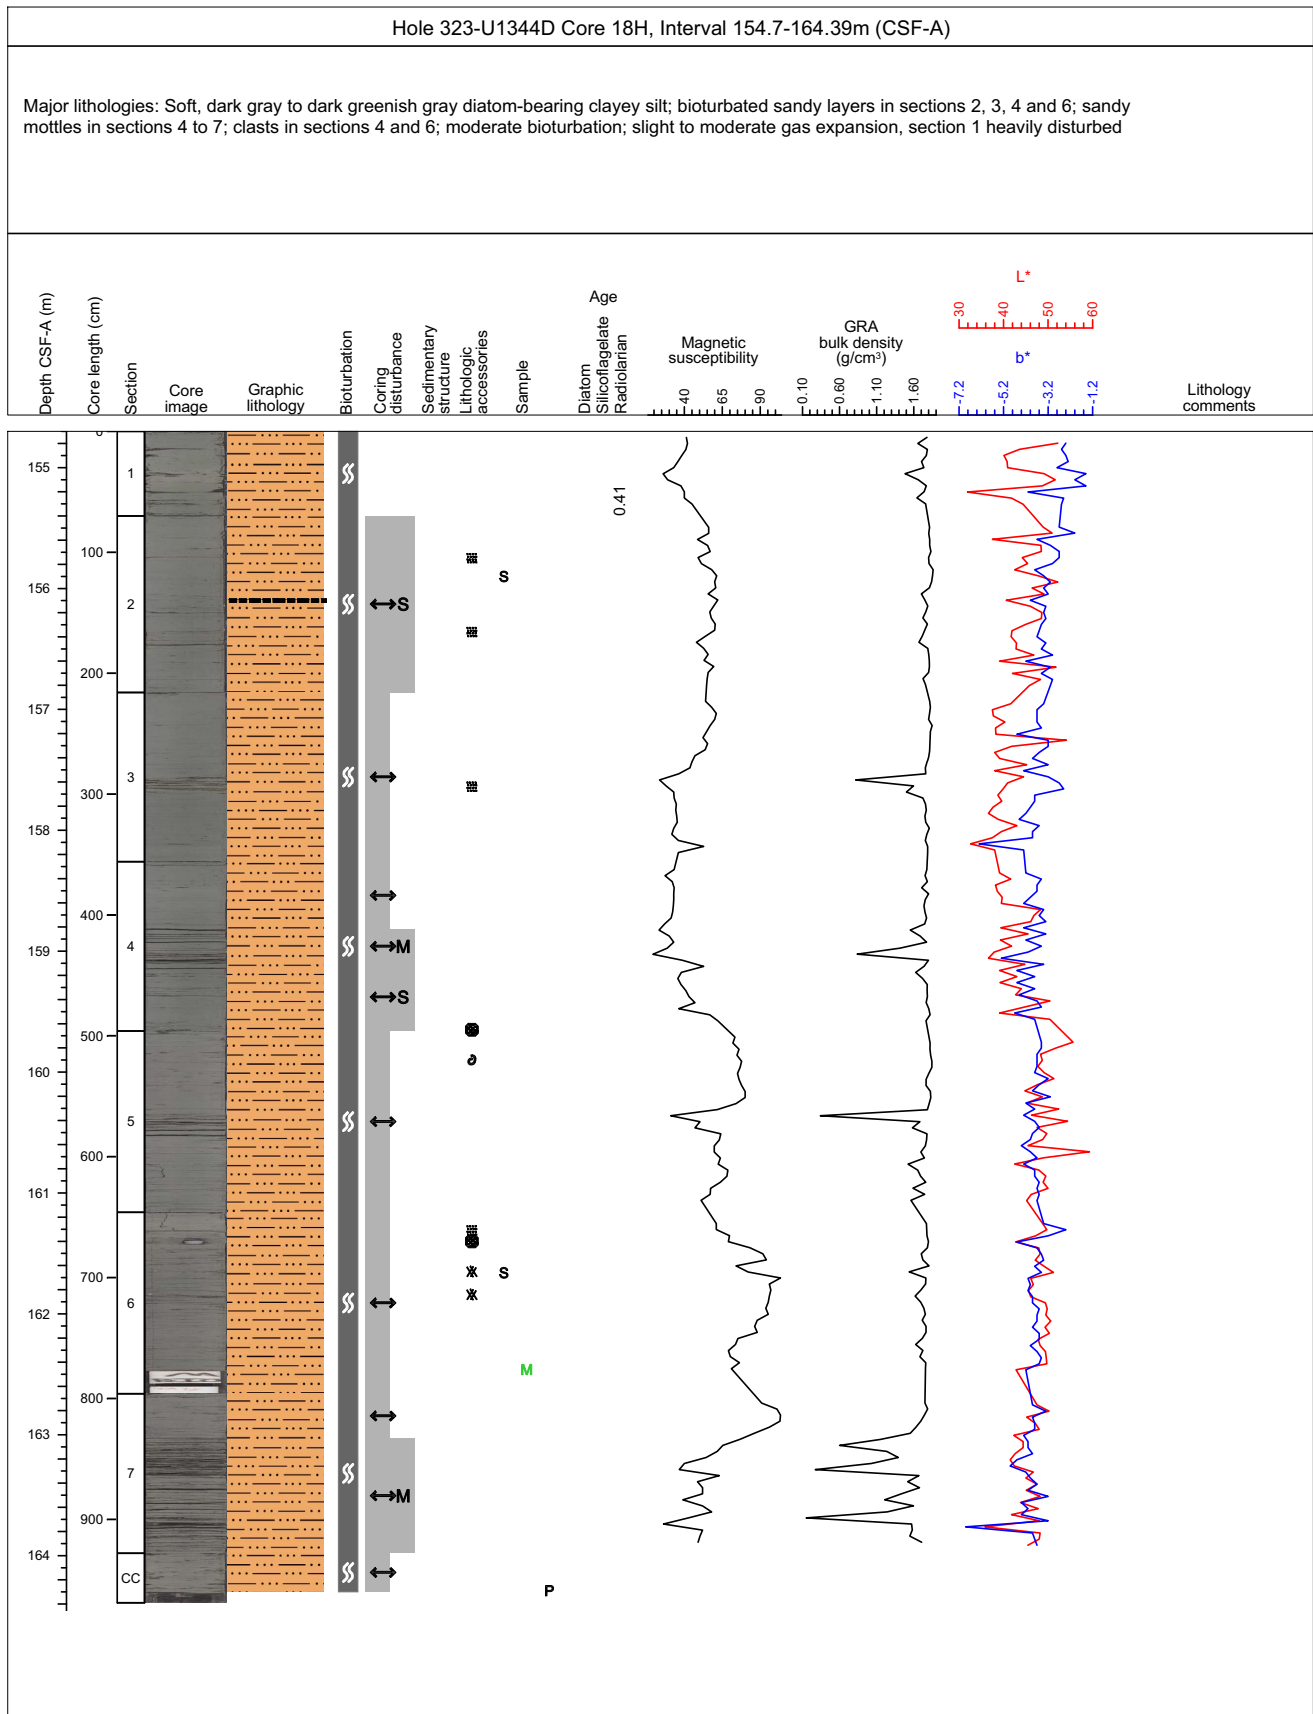

### Core Photo

### Core Photo

Hole 323-U1344D Core 25H, Interval 221.2-224.51m (CSF-A)

The main lithology is dark greenish gray diatom-rich silty clay. A small pebble and sandy mottles are present in section 1. An ash and a sandy layer occur in section 2. The core shows light-colored authigenic carbonate-rich layers and patches throughout. Mottling is also present.

### Core Photo

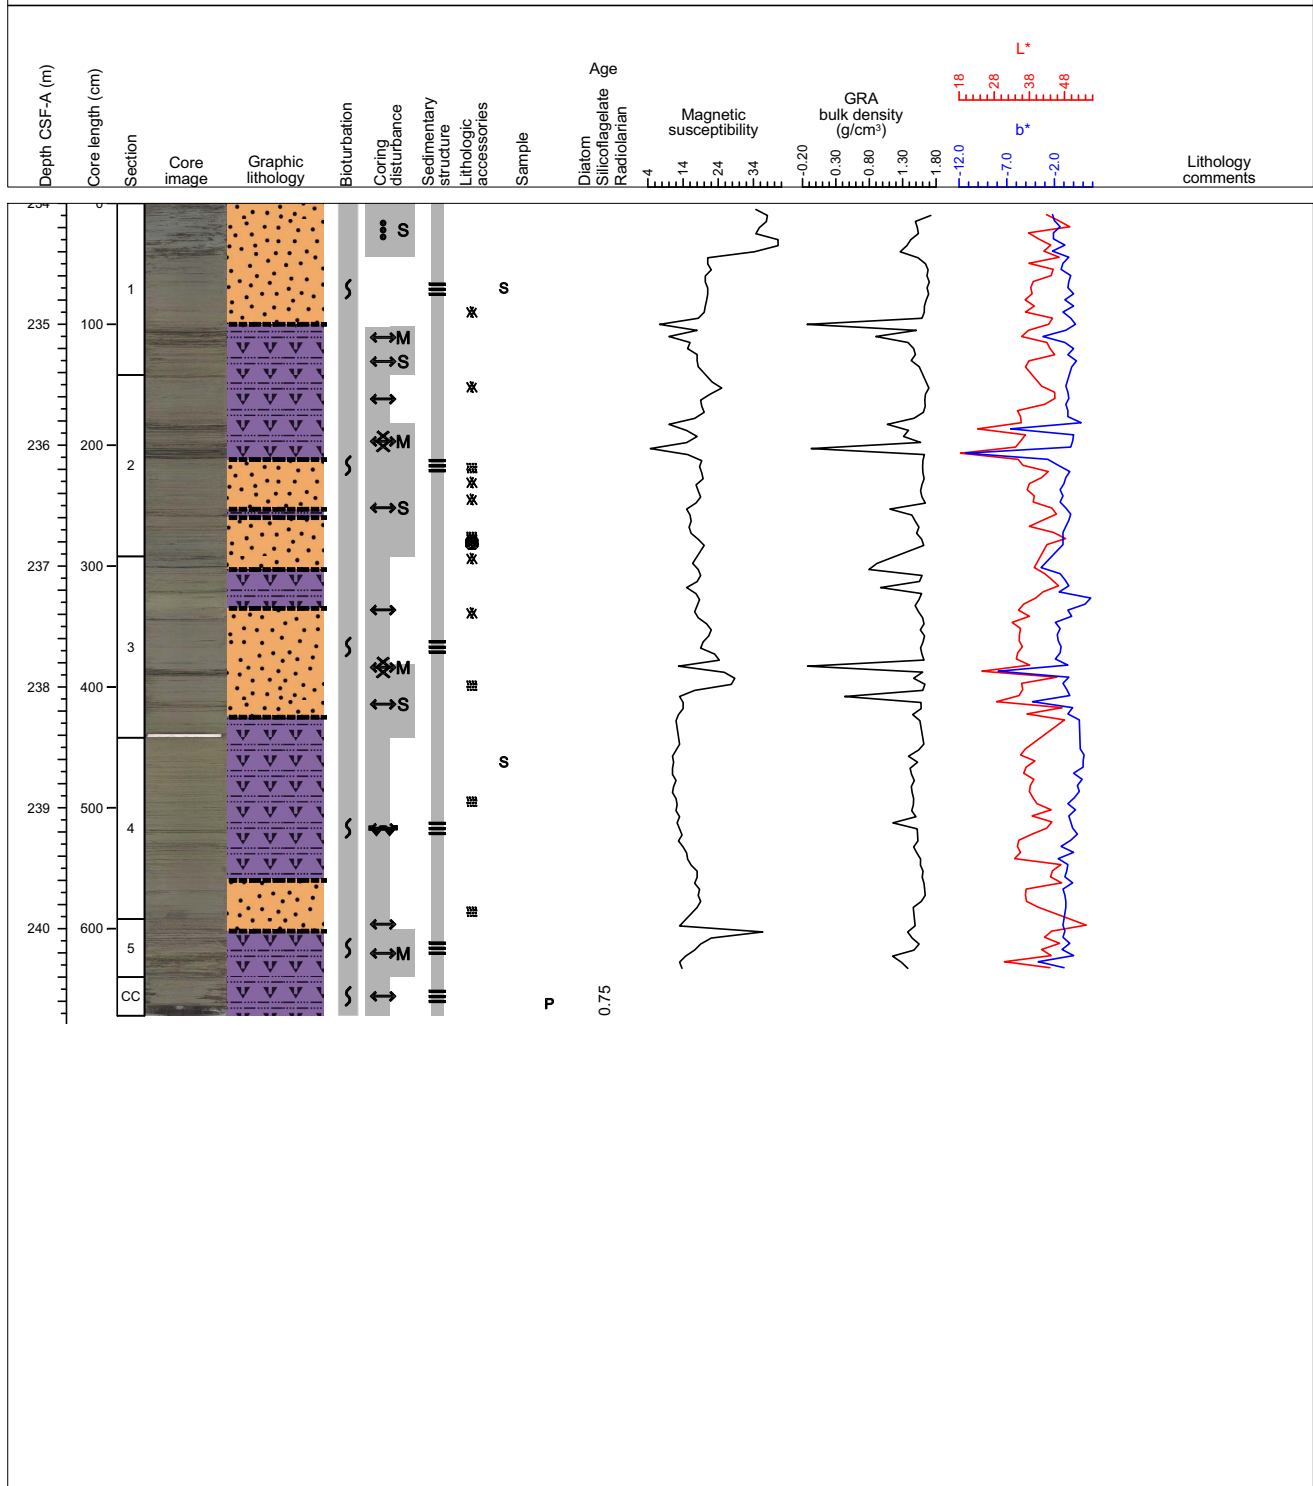

### Core Photo

Hole 323-U1344D Core 27H, Interval 234.0-240.72m (CSF-A)

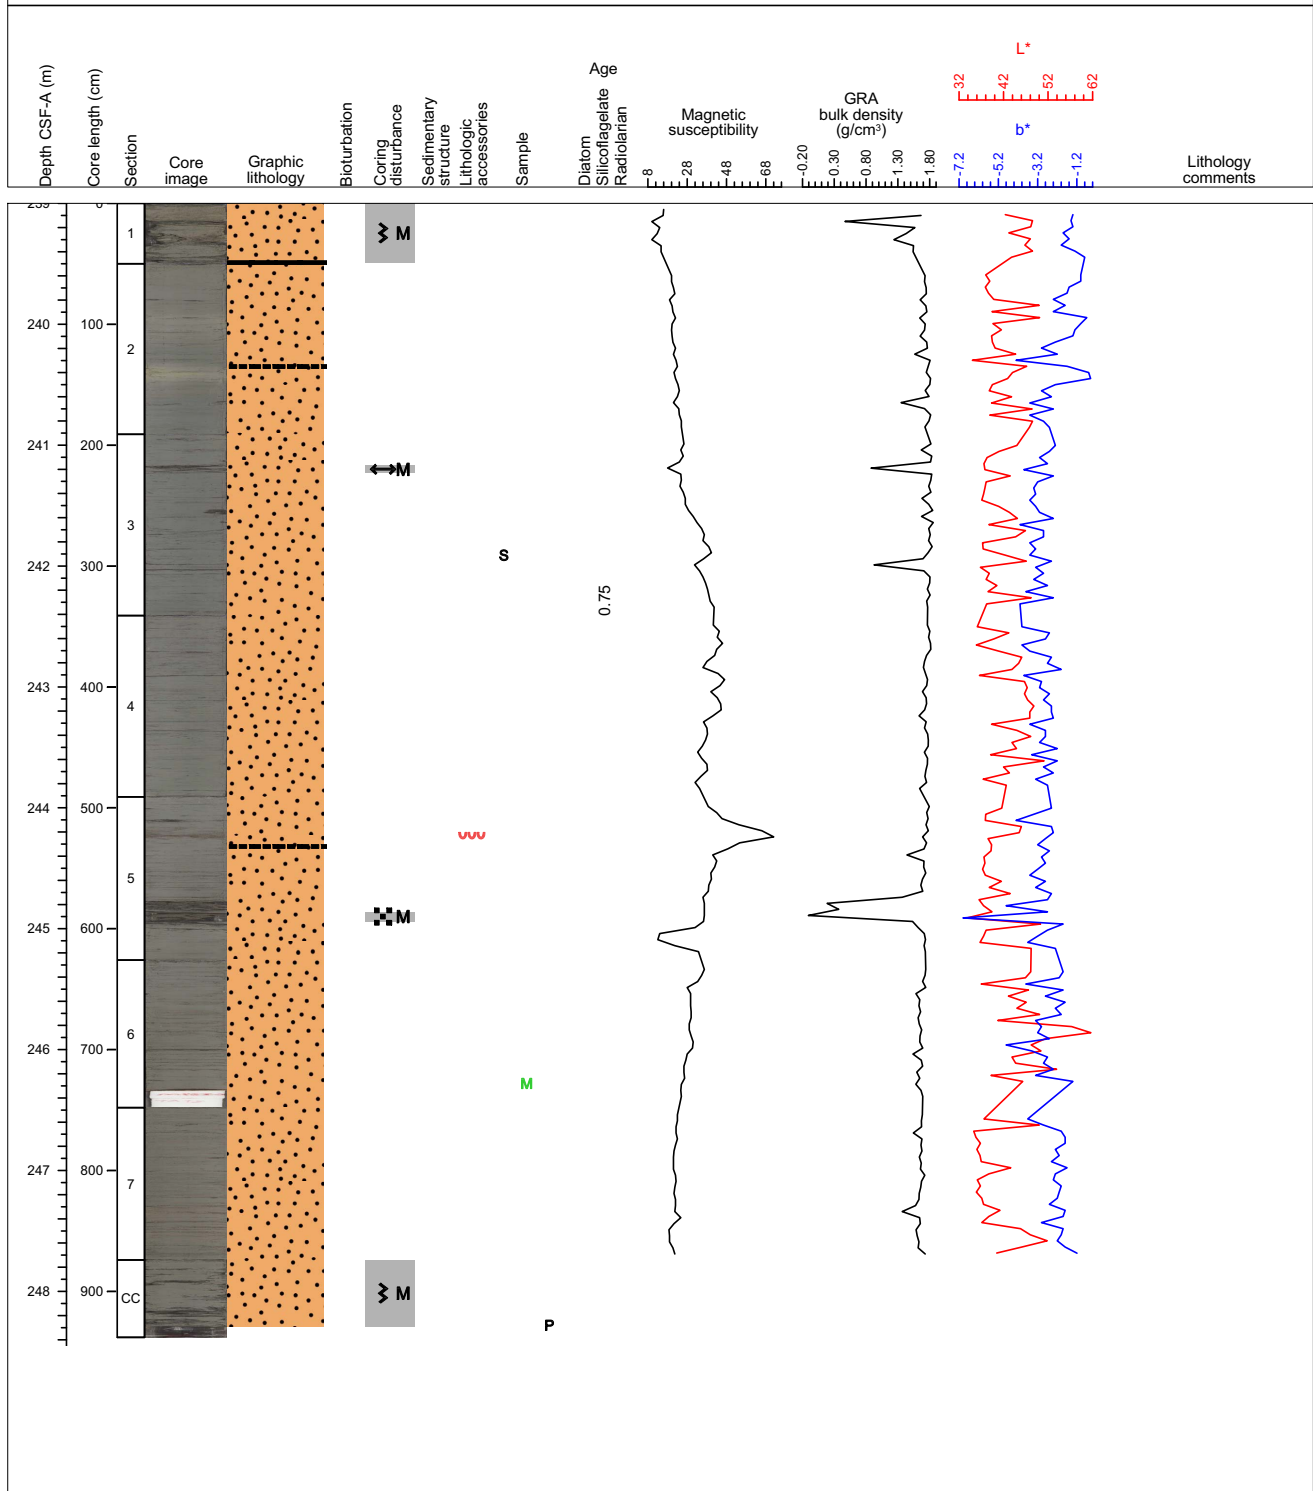

Major lithologies: alternating thick beds of very dark greenish gray diatom-rich silt and dark greenish gray diatom silty clay. Bioturbation is slight throughout the core with sand and dark green mottles. Several sandy layers are also observed, especially along cracks. Gas expansion led to slight to moderate drilling disturbance. The more diatom-rich lithology (diatom silty clay) tended to crack and expand more than the grayer lithology (diatom-rich silt).

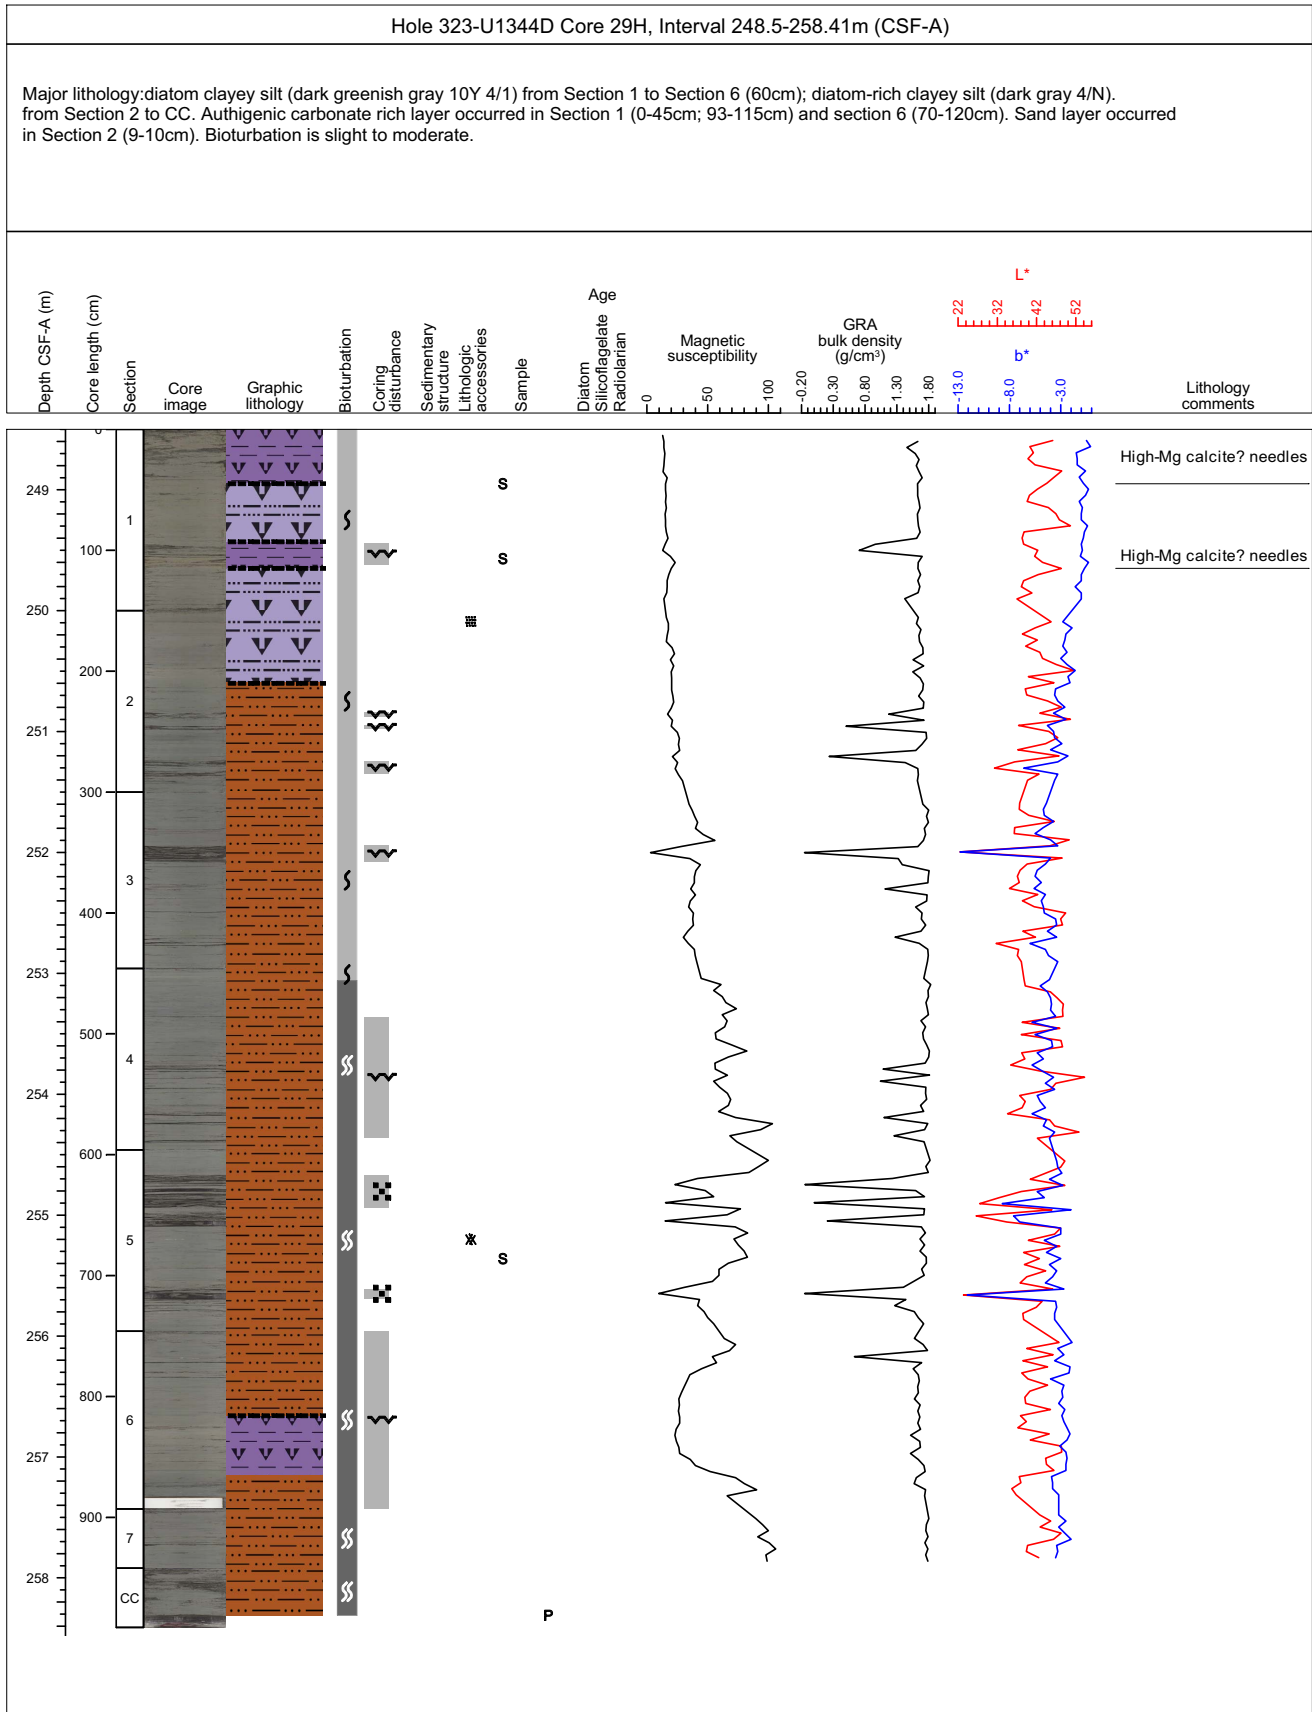

### Core Photo

Hole 323-U1344D Core 28H, Interval 239.0-248.38m (CSF-A)

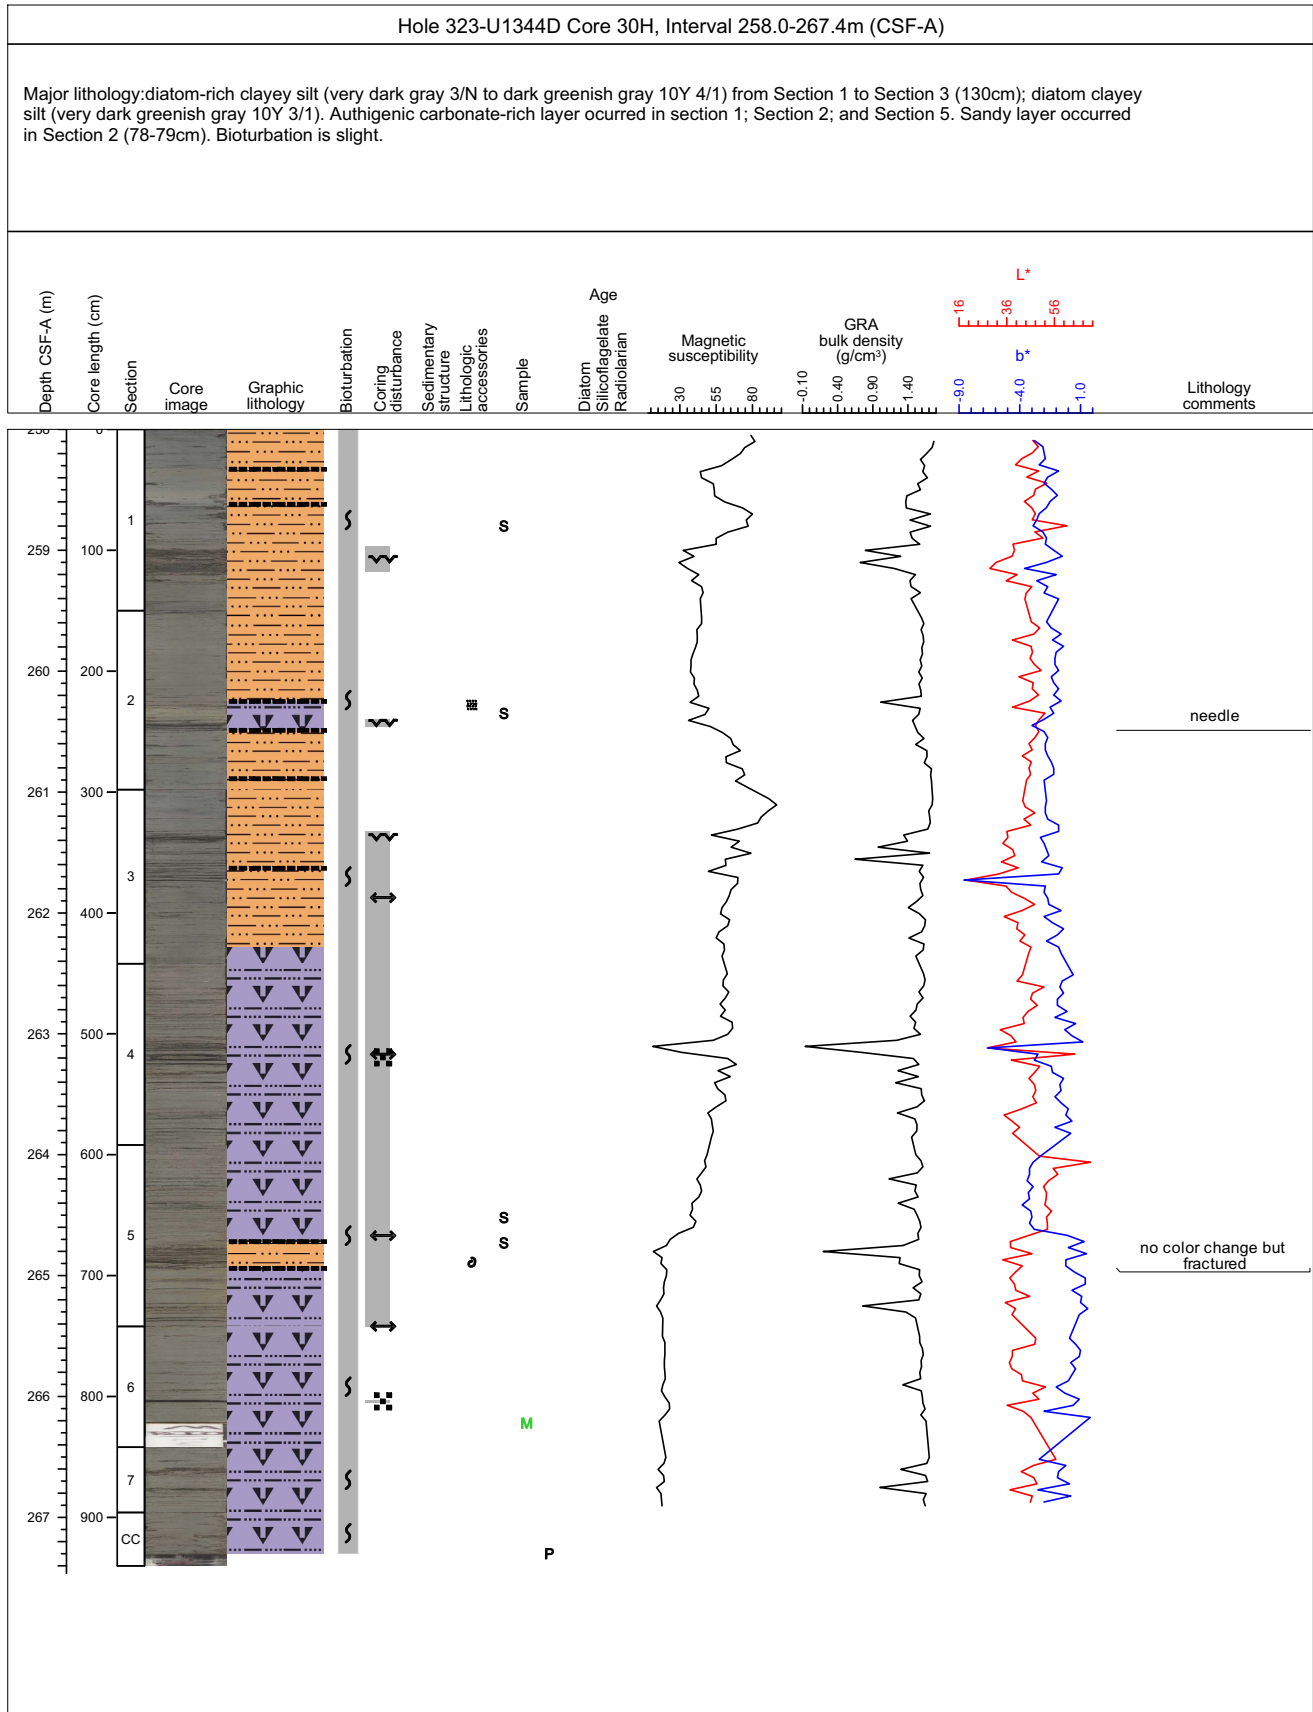

The main lithologies are very dark greenish gray diatom-rich silt (sections 1 and 5 to CC), dark greenish gray authigenic carbonate diatom-rich silt (mainly section 2), and dark grey diatom-bearing silt (sections 3 and 4). Sulfide specks and mottles occur throughout the core. A sand and an ash mottle occur in sections 3 and 5, respectively.

### Core Photo

### Core Photo

### Core Photo

Hole 323-U1344D Core 31H, Interval 267.5-277.96m (CSF-A)

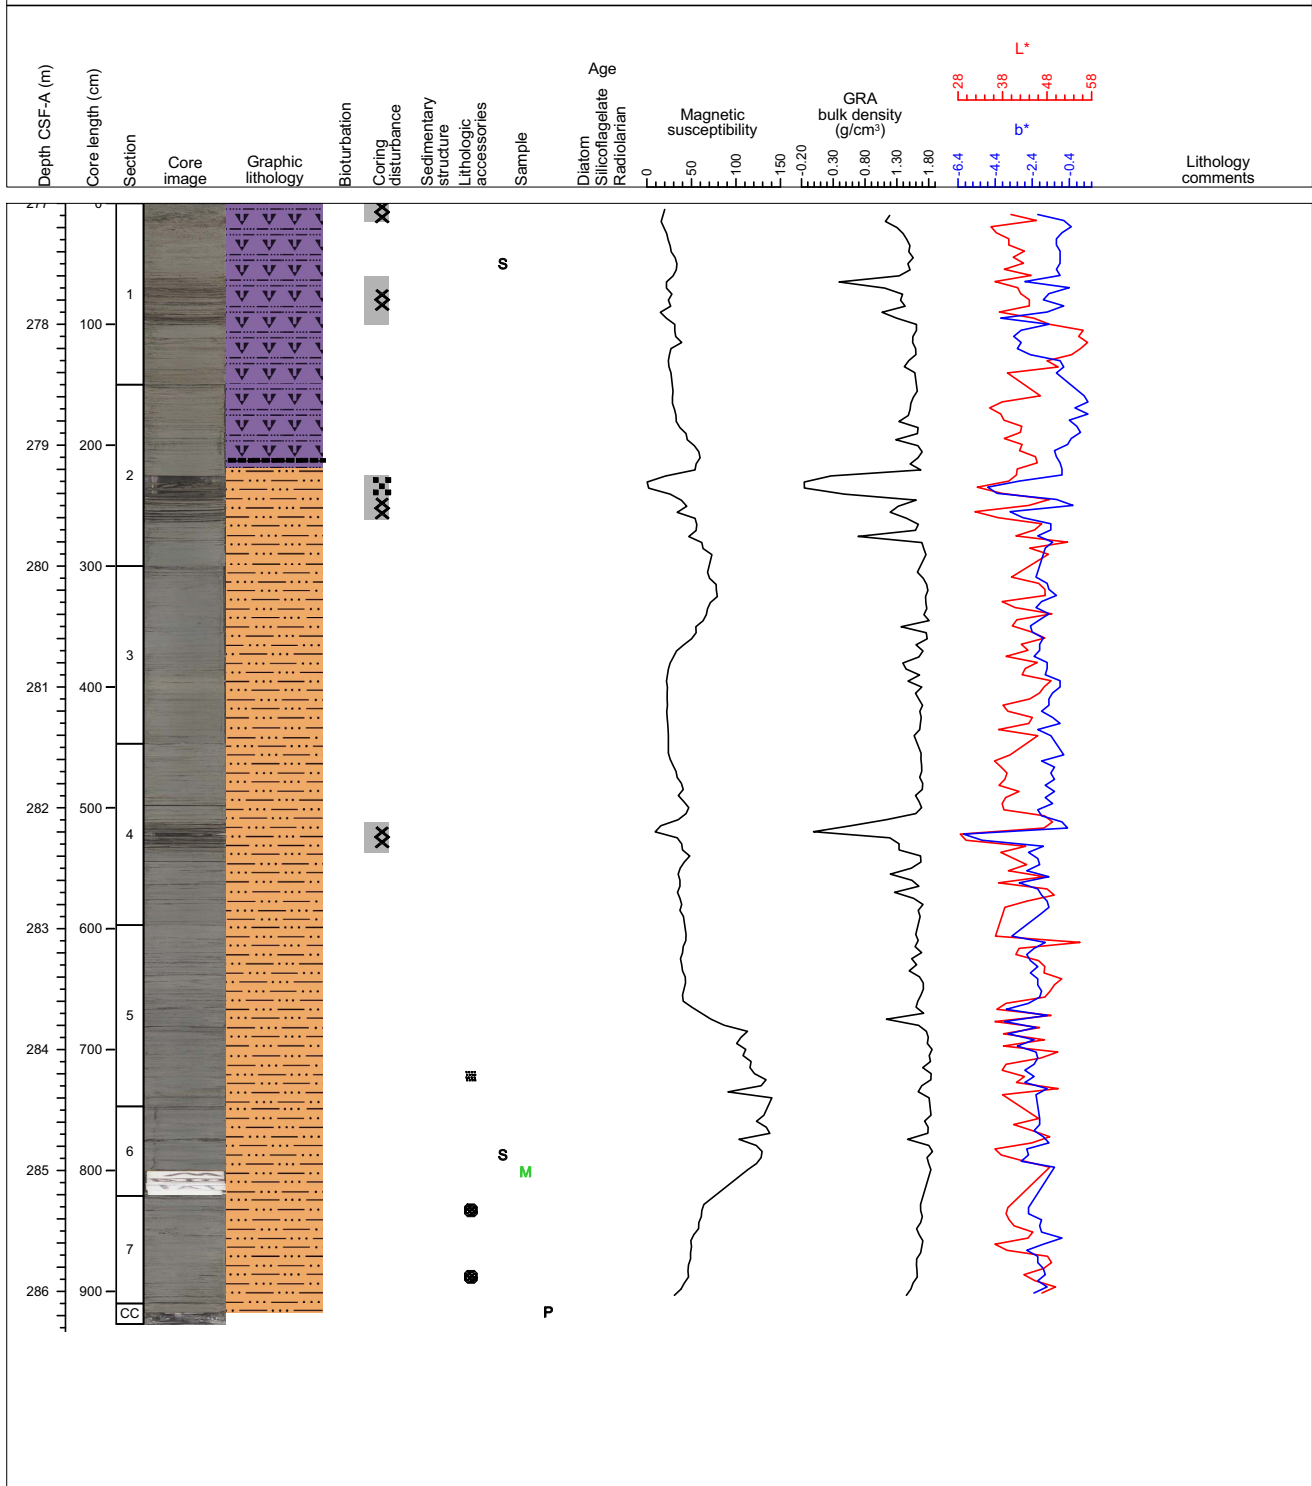

Major lithology: greenish black diatom-rich clayey silt. Secondary lithology: dark greenish gray authigenic carbonate-rich diatom clayey silt. Bioturbation is slight to moderate throughout with sand filled chondrites burrows occurring frequently. Pyrite smears and specks are also common. Drilling disturbance is often severe with large voids and cracks created by gas expansion.

### Core Photo

Hole 323-U1344D Core 32H, Interval 277.0-286.27m (CSF-A)

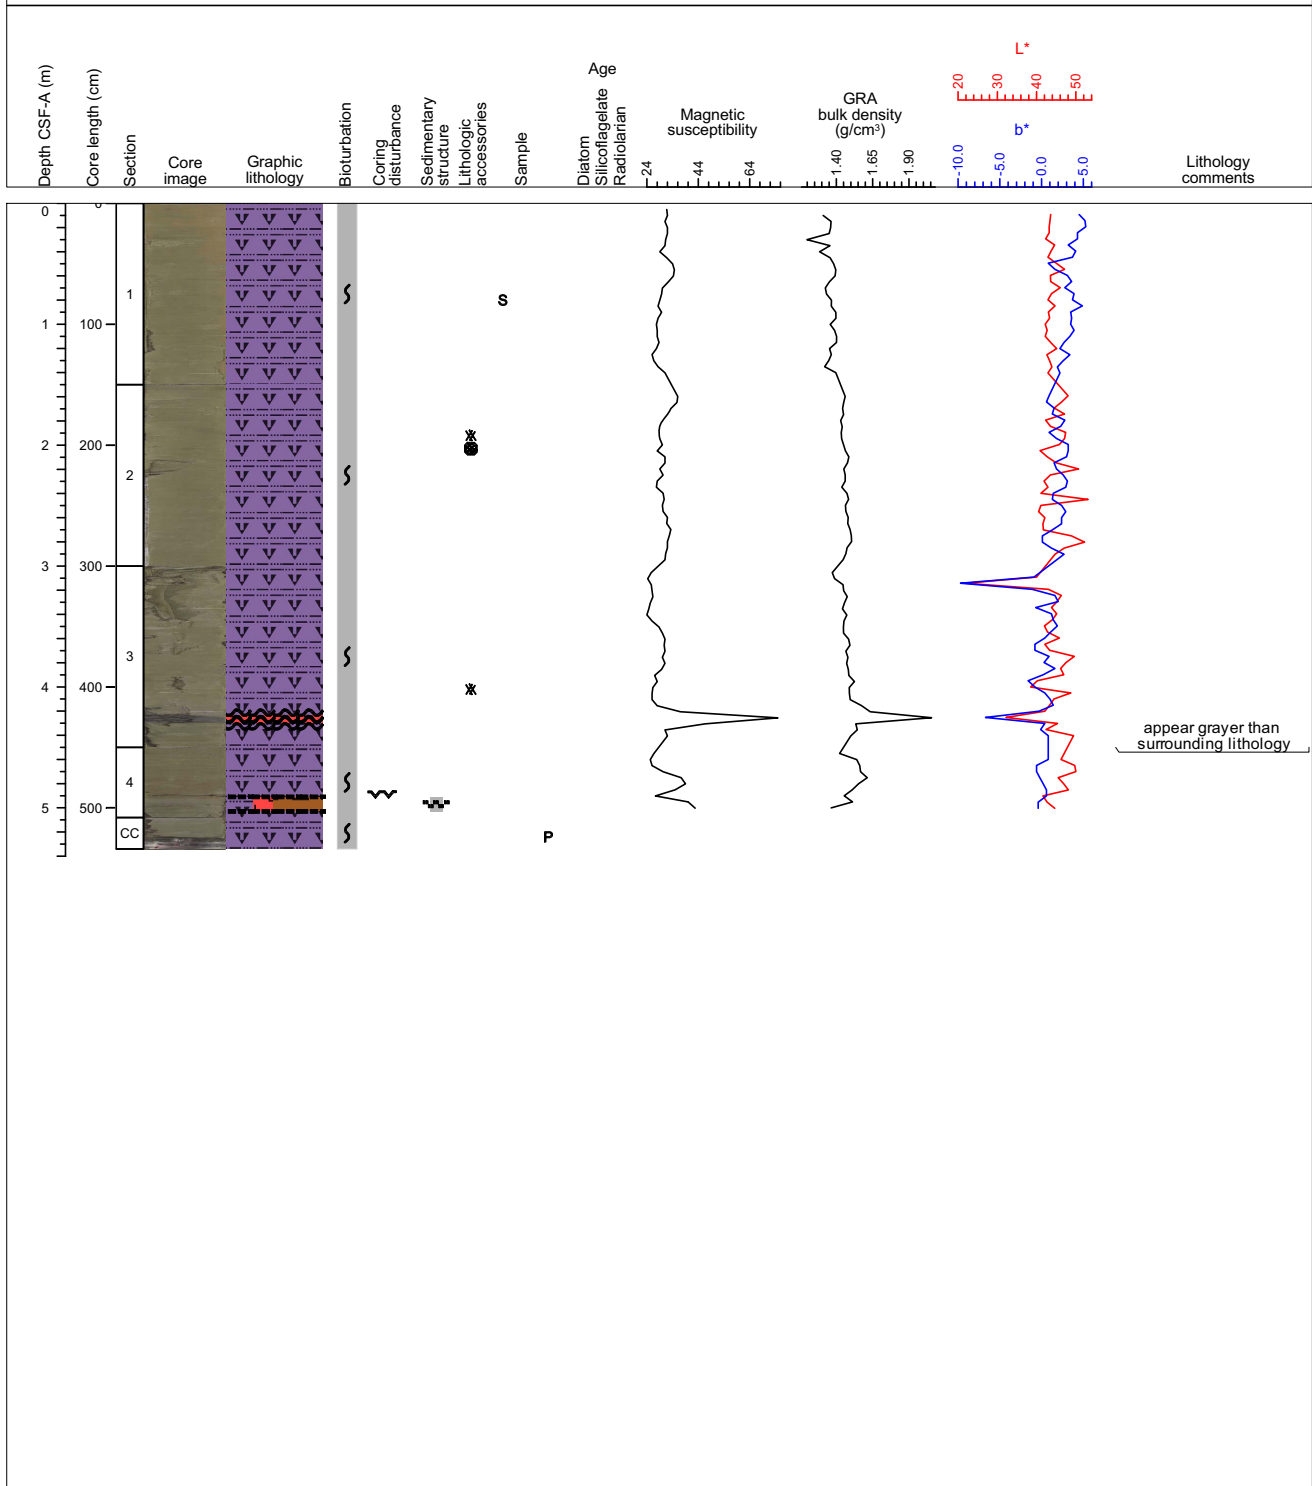

The main lithology is very dark gray diatom-bearing clayey silt. The secondary lithology, very dark greenish gray diatom clay silt occurs only in section 1 and top of section 2. Sand mottles and layers are concentrated in sections 5 to 7 although slight black mottles occur throughout the core. Two small pebbles were found in section 7.

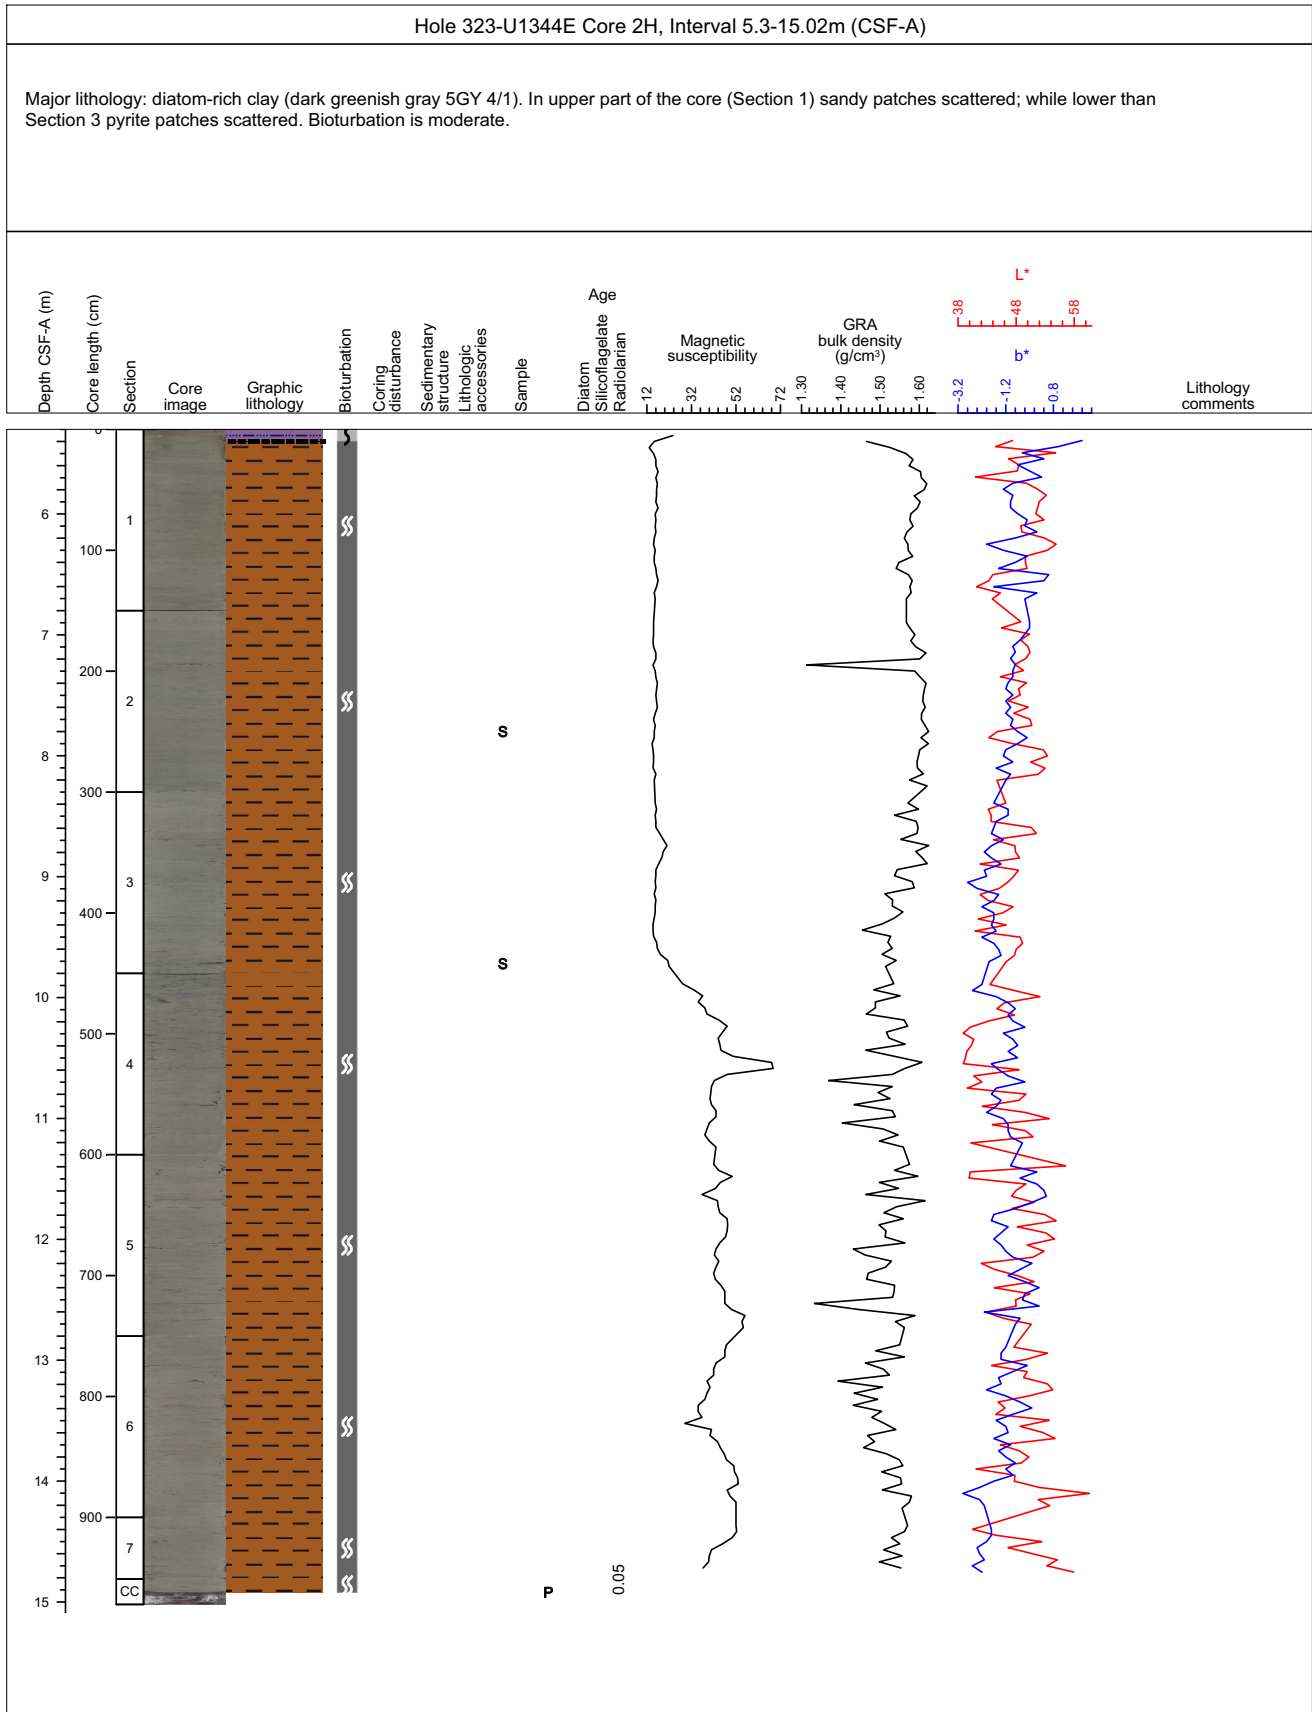

### Core Photo

Hole 323-U1344E Core 1H, Interval 0.0-5.34m (CSF-A)

Major lithology: olive diatom silty clay. Secondary lithology: dark greenish gray diatom-bearing clay present only in faintly laminated interval. A 6 cm thick ash layer is present in section 3 with sharp, undulating and tipped lower and upper boundaries. Bioturbation is faint and slight throughout the core with faint mottles occasionally. Disturbance is severe especially in section 3 where a shattered core liner was dragged through the core during splitting.

### Core Photo

### Core Photo

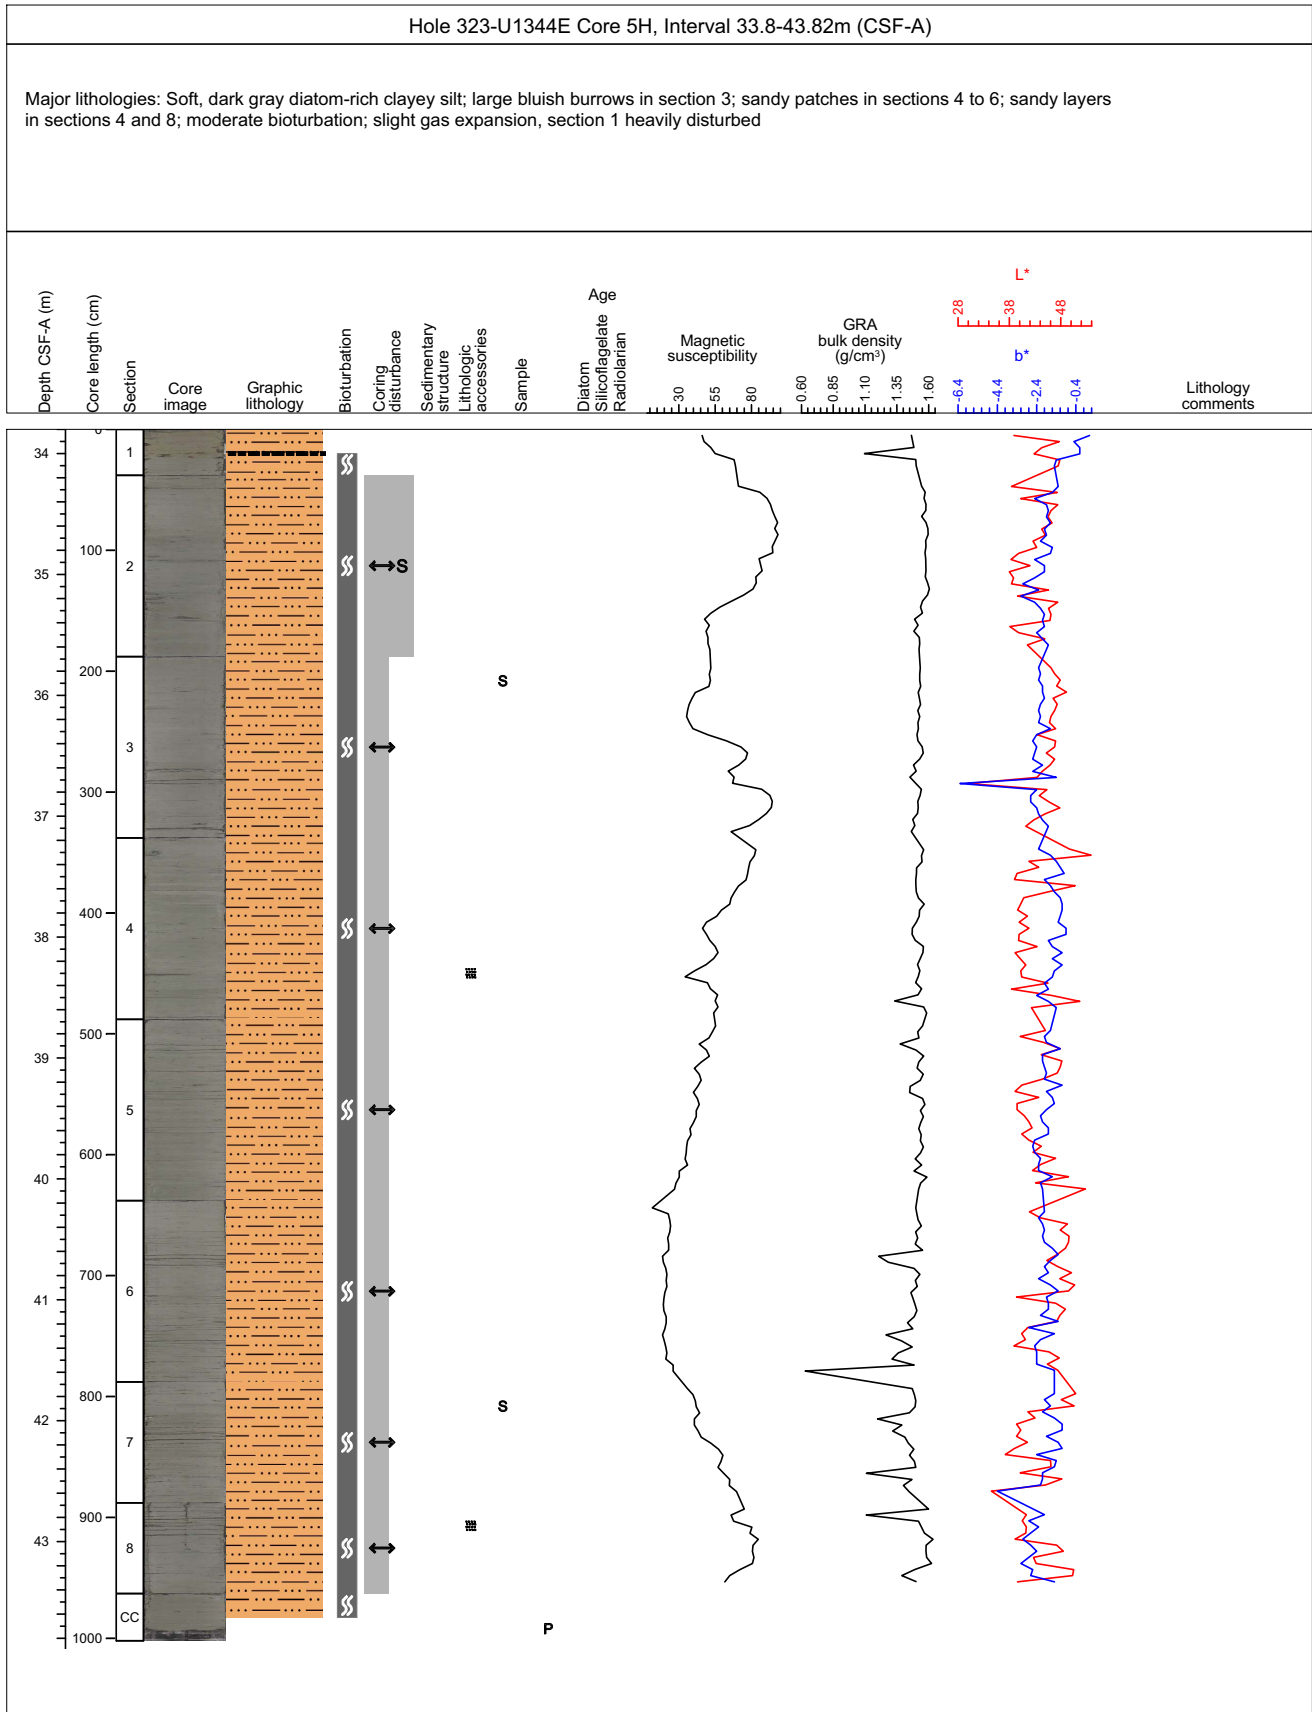

Hole 323-U1344E Core 3H, Interval 14.8-24.85m (CSF-A)

Major lithology homogeneous diatom-rich clay (dark greenish gray 5GY 4/1). Big green skolithos occurred in Section 3 to Section 4. Sandy layer occurred in Section 4 (20-21cm). Bioturbation is slight.

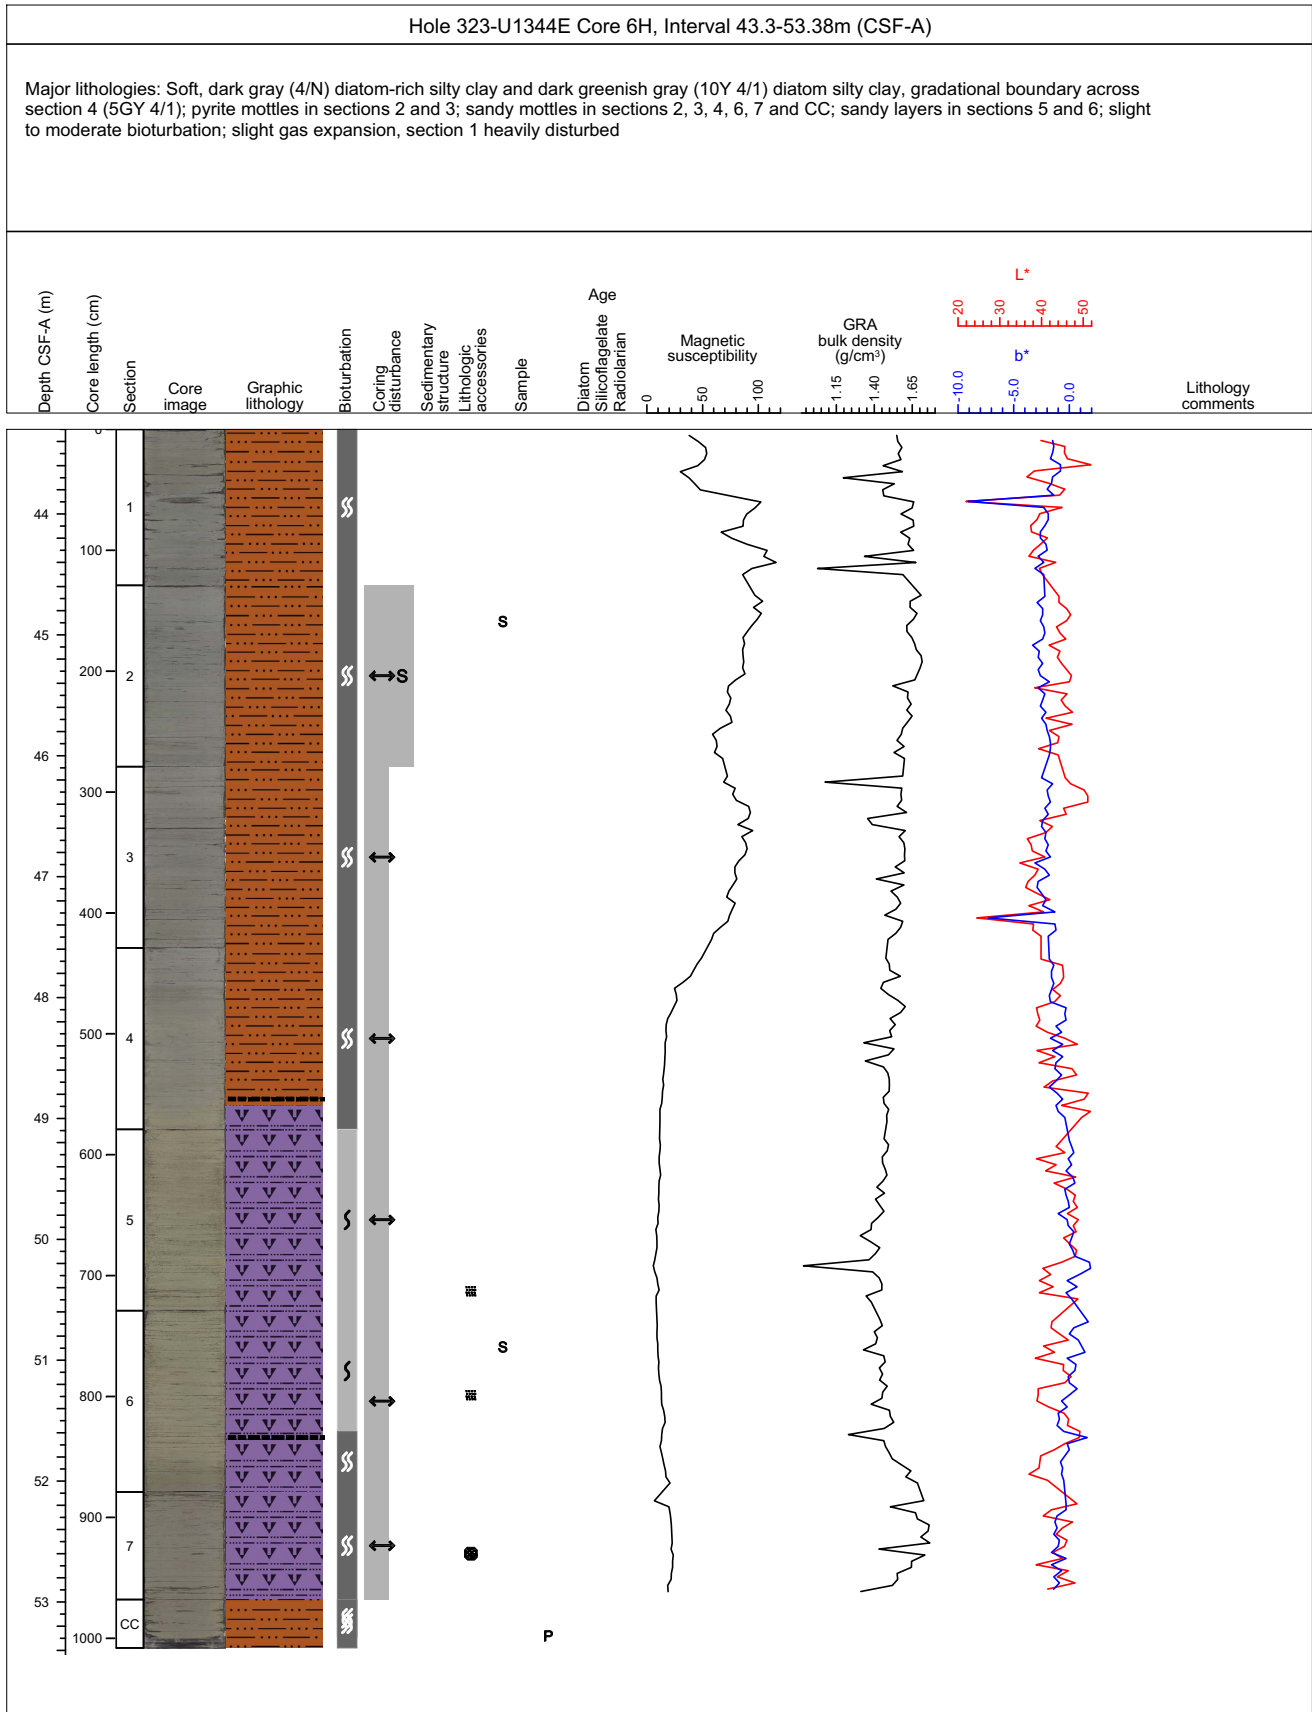

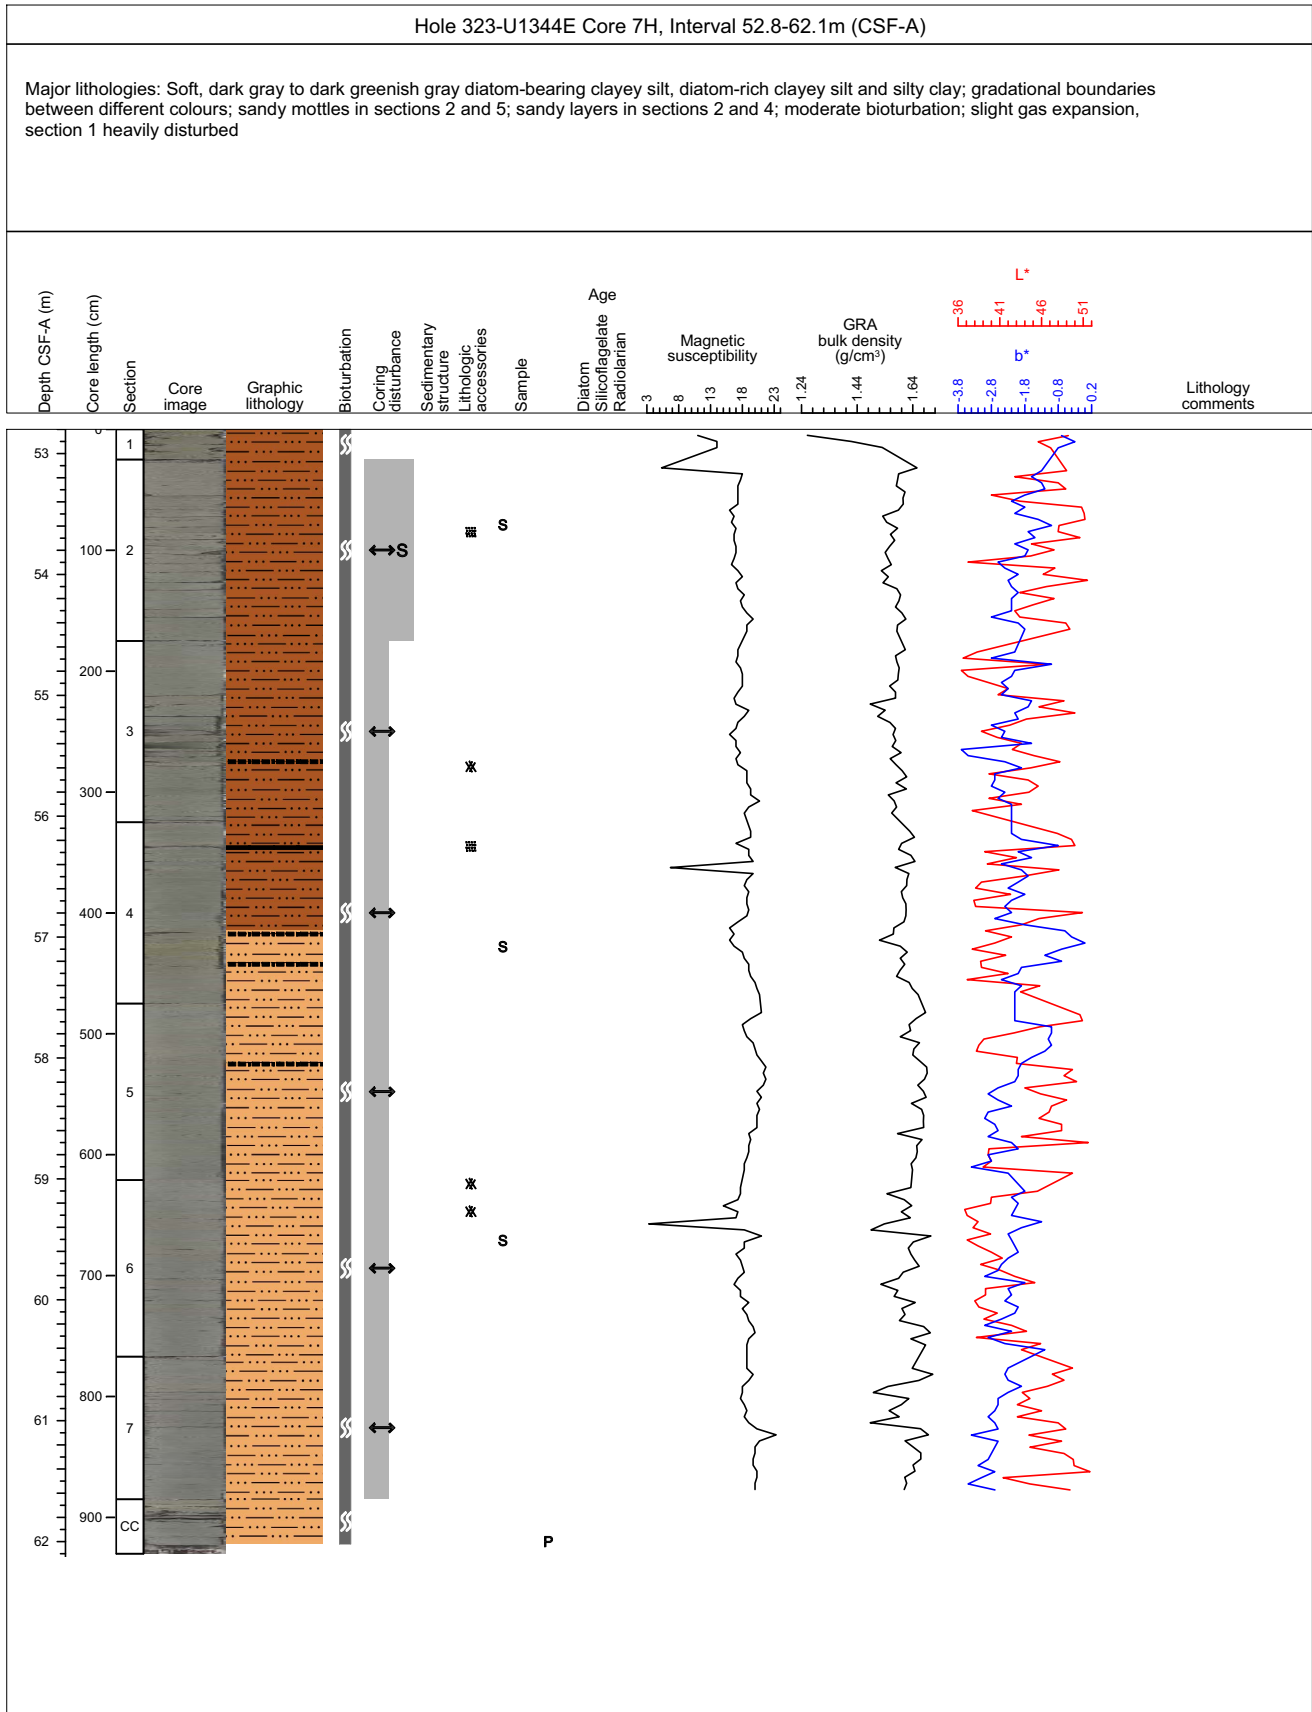

### Core Photo

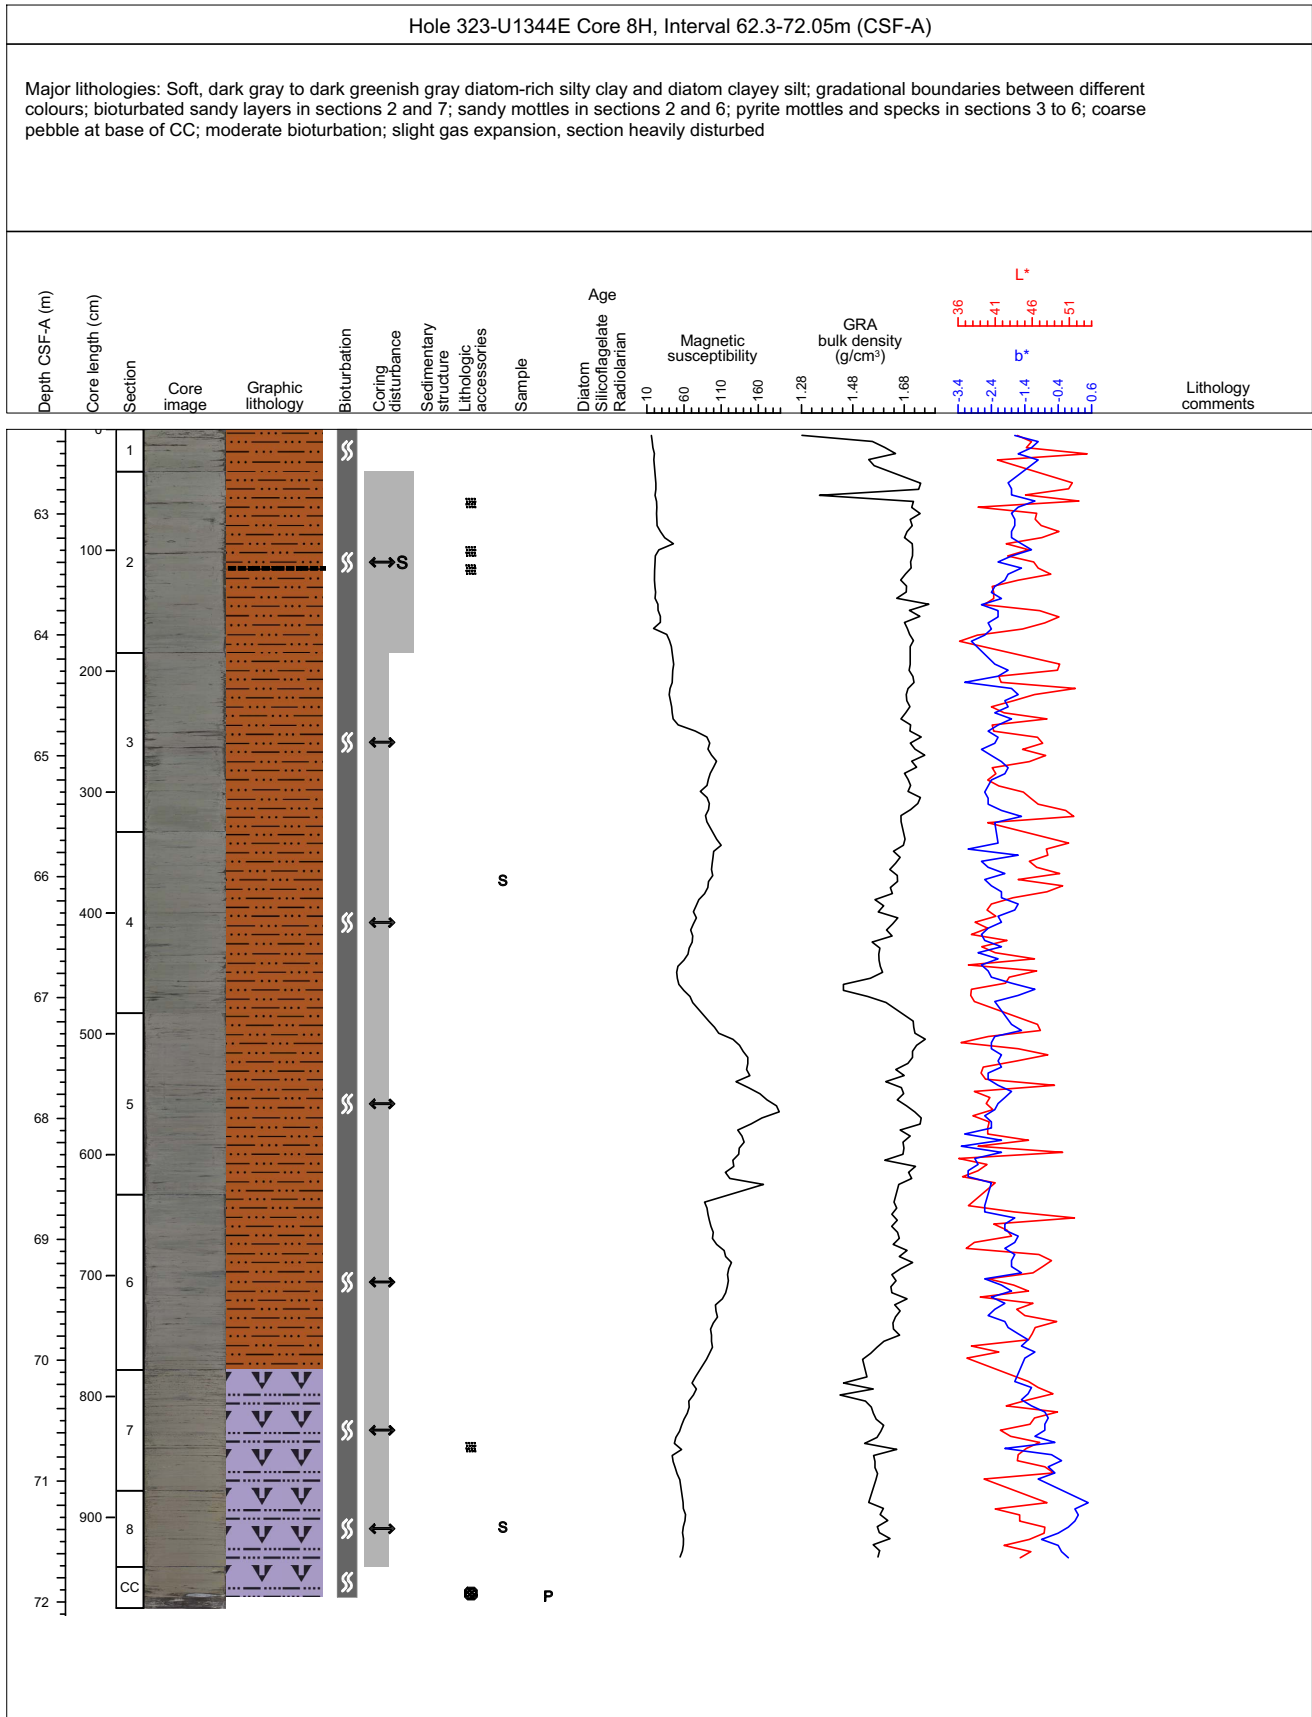

### Core Photo

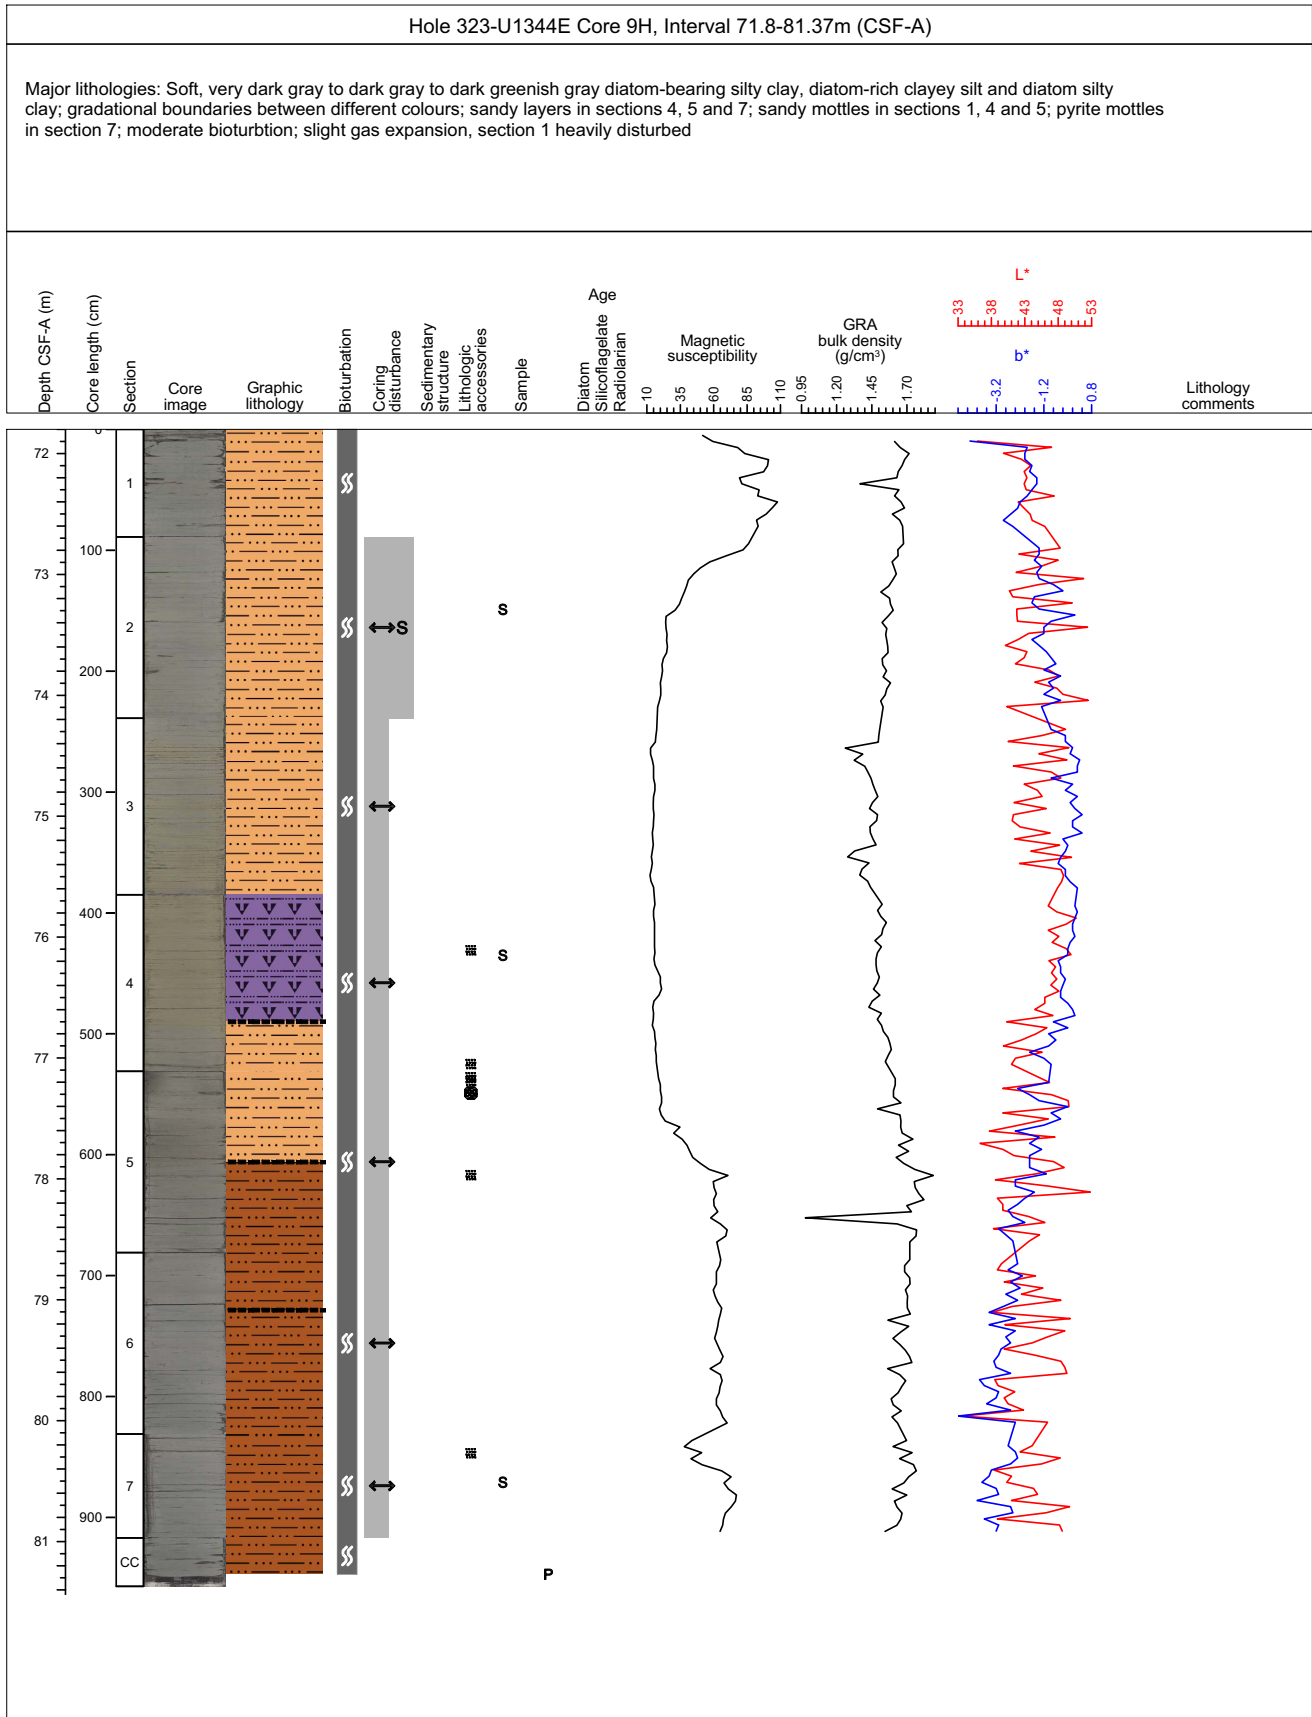

### Core Photo

### Core Photo

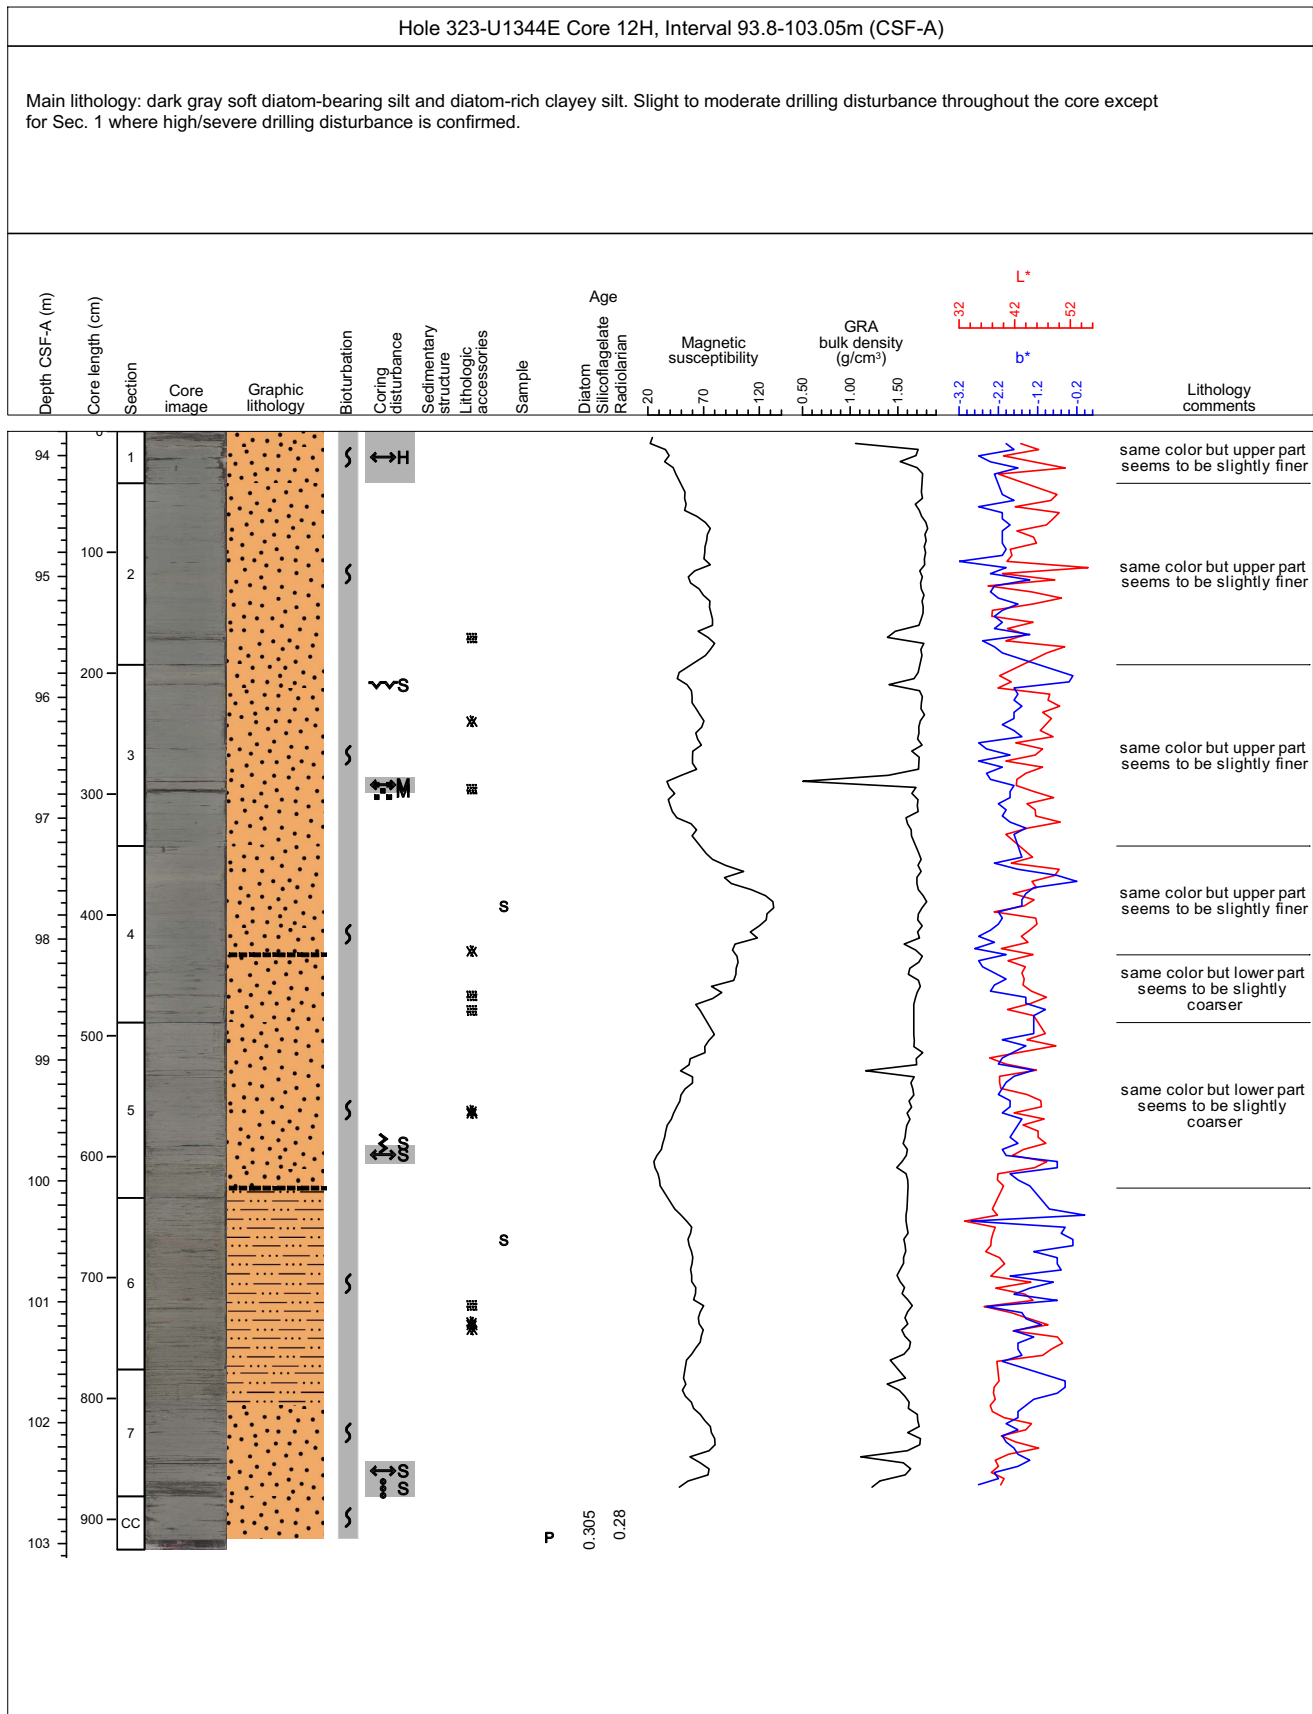

### Core Photo

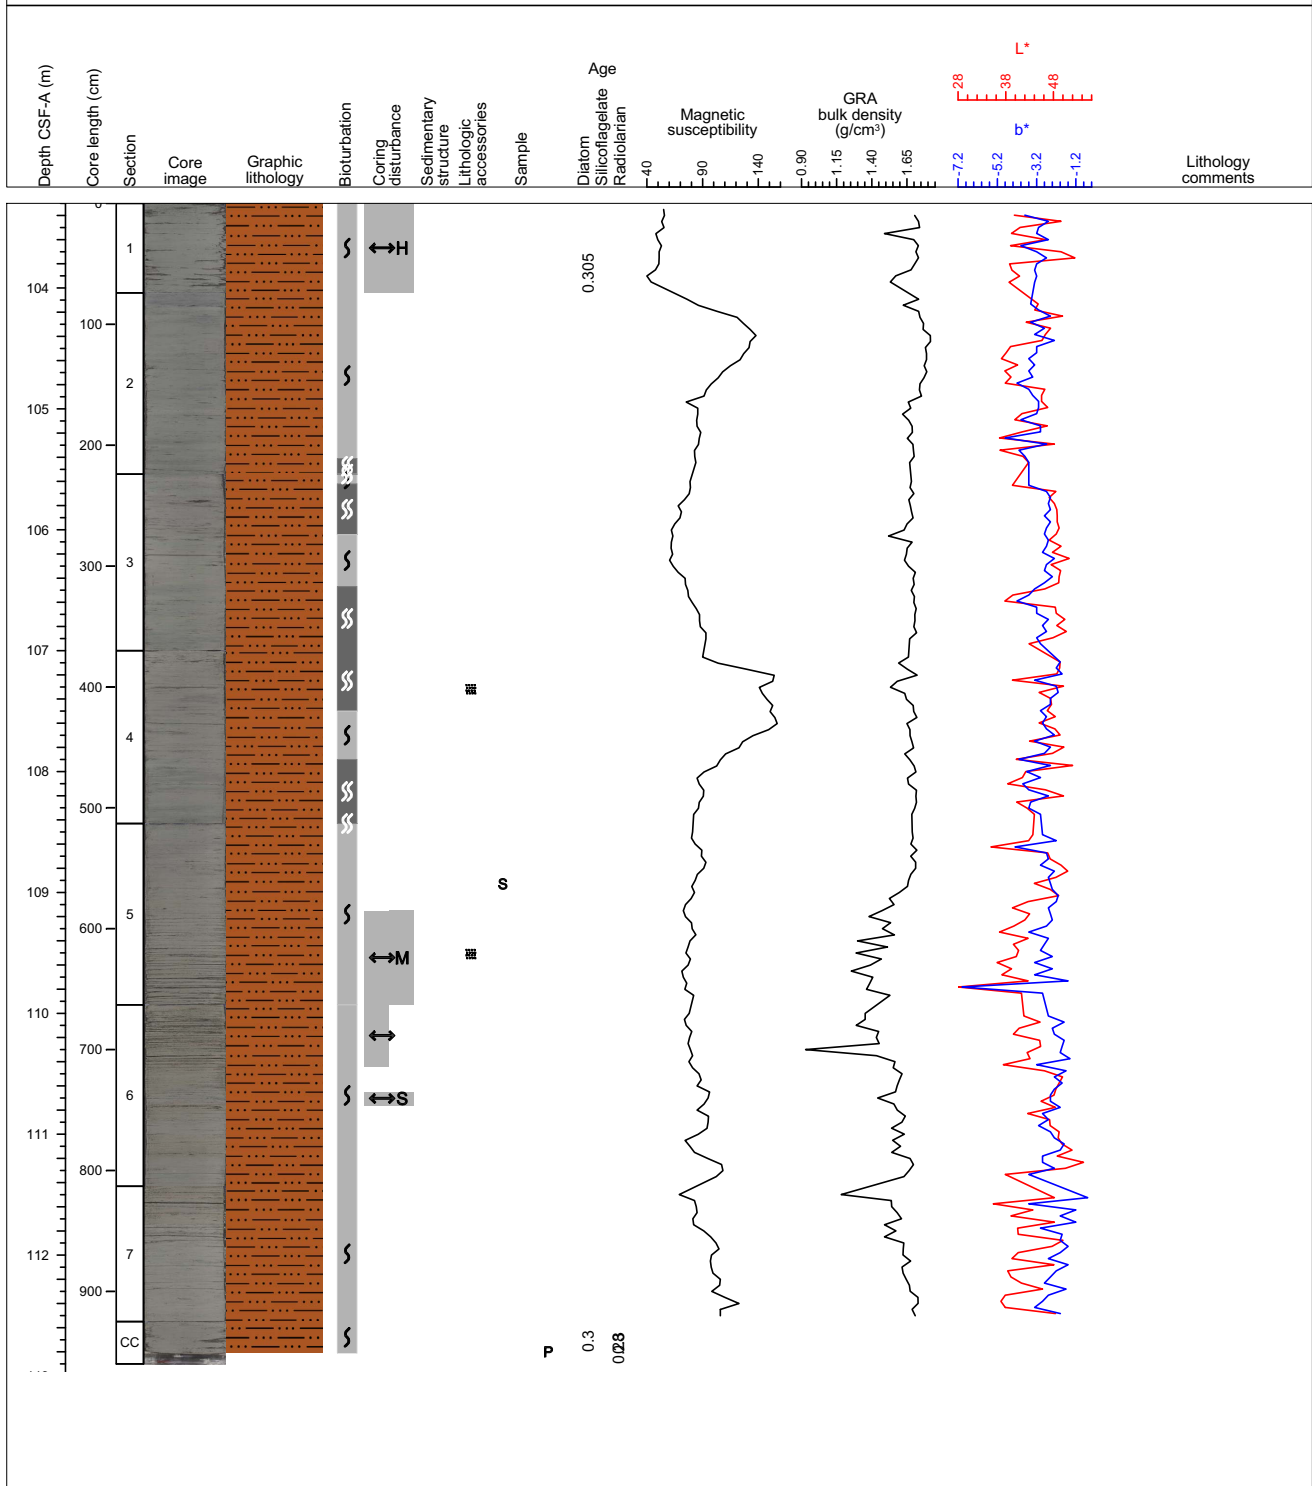

### Core Photo

### Core Photo

Hole 323-U1344E Core 13H, Interval 103.3-112.9m (CSF-A)

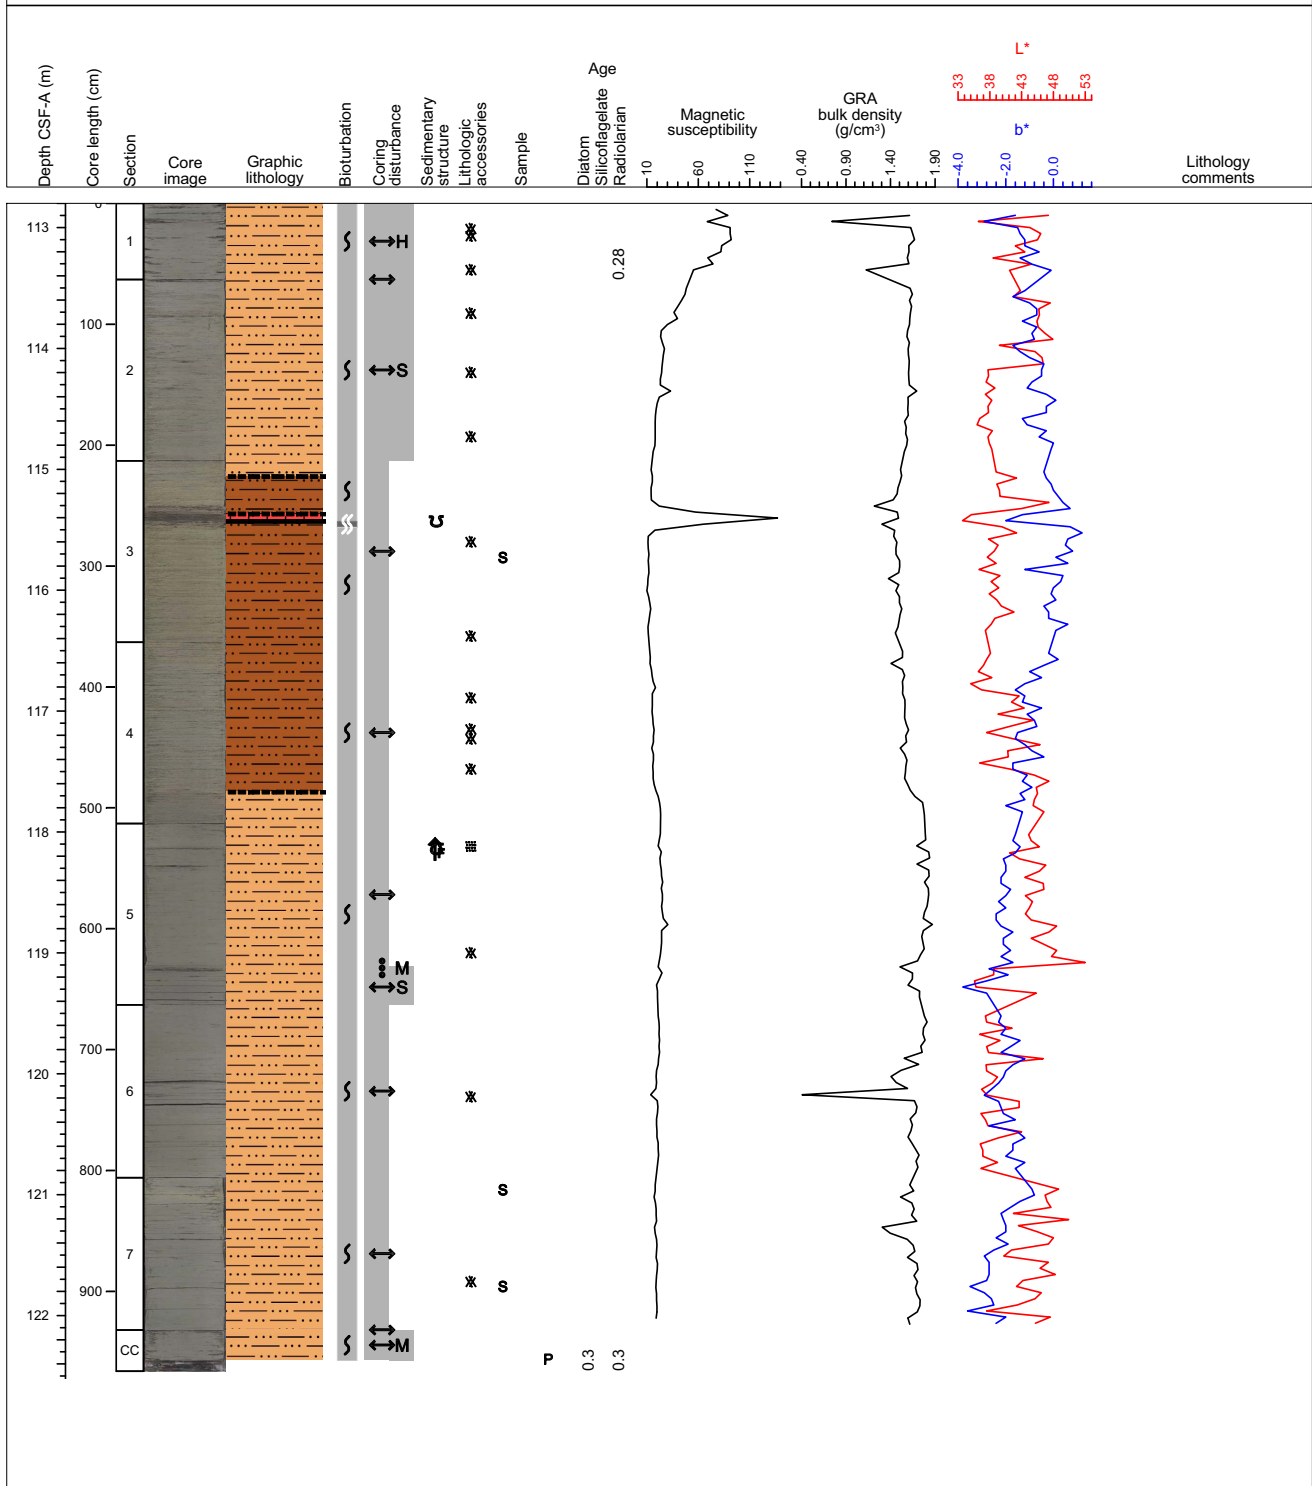

Main lithology: soft dark gray diatom-rich silty clay. There is only one lithology in this core. Black pyrite specks (or mottles) are present throughout the core. Intensity of those varies and bioturbated moderately at Sec. 2-4. and slightly at the rest of the core. Sandy layer or patch occurs at Sec. 4 and 5.

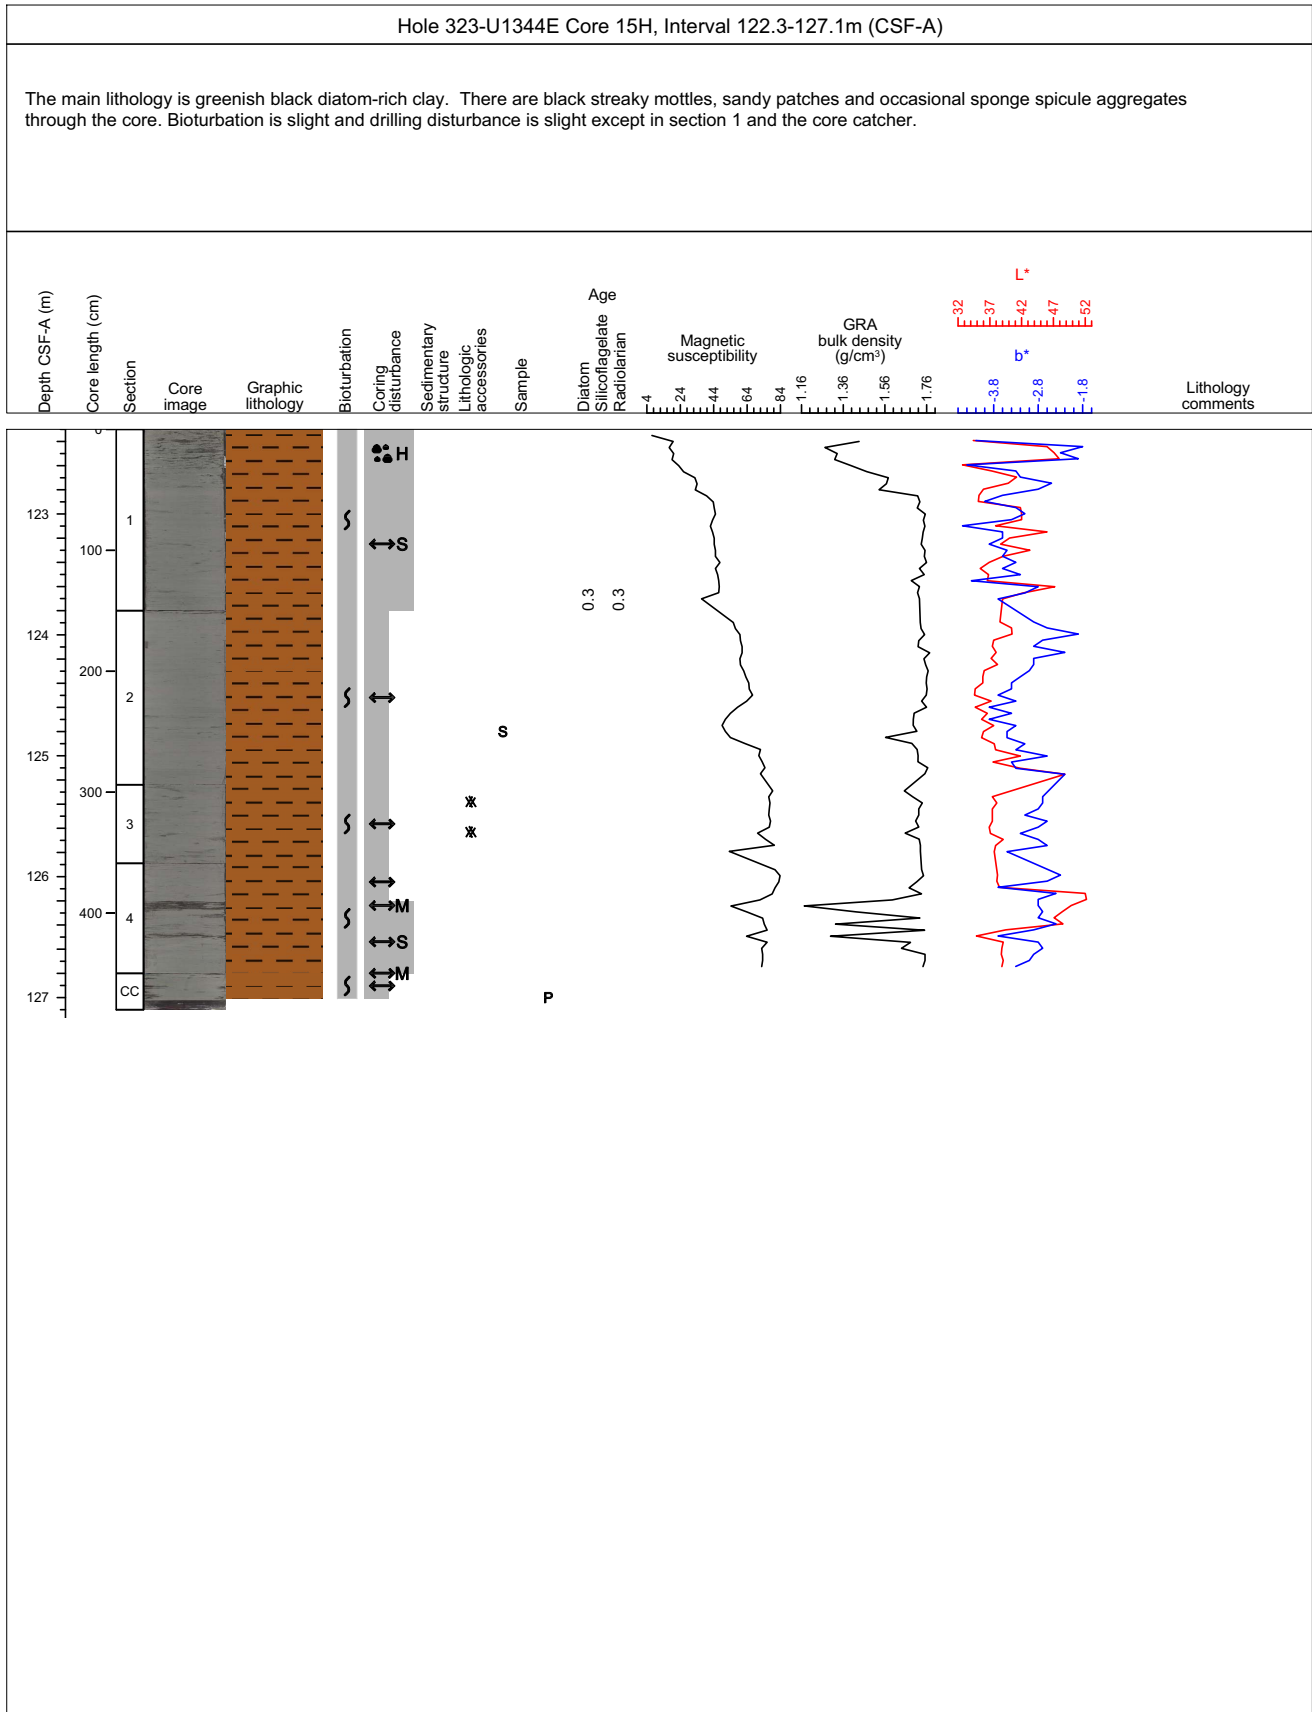

### Core Photo

Hole 323-U1344E Core 14H, Interval 112.8-122.46m (CSF-A)

The main lithologies are very dark greenish grey diatom-rich clayey silt and dark greenish grey diatom-rich silty clay. There is a very dark brown ash layer in section 3 and authigenic carbonate mottling in section 7. There are sandy mottles and sponge spicules throughout the core. Bioturbation varies from slight to moderate. Drilling disturbance is minor except in the core catcher and section 1.

### Core Photo

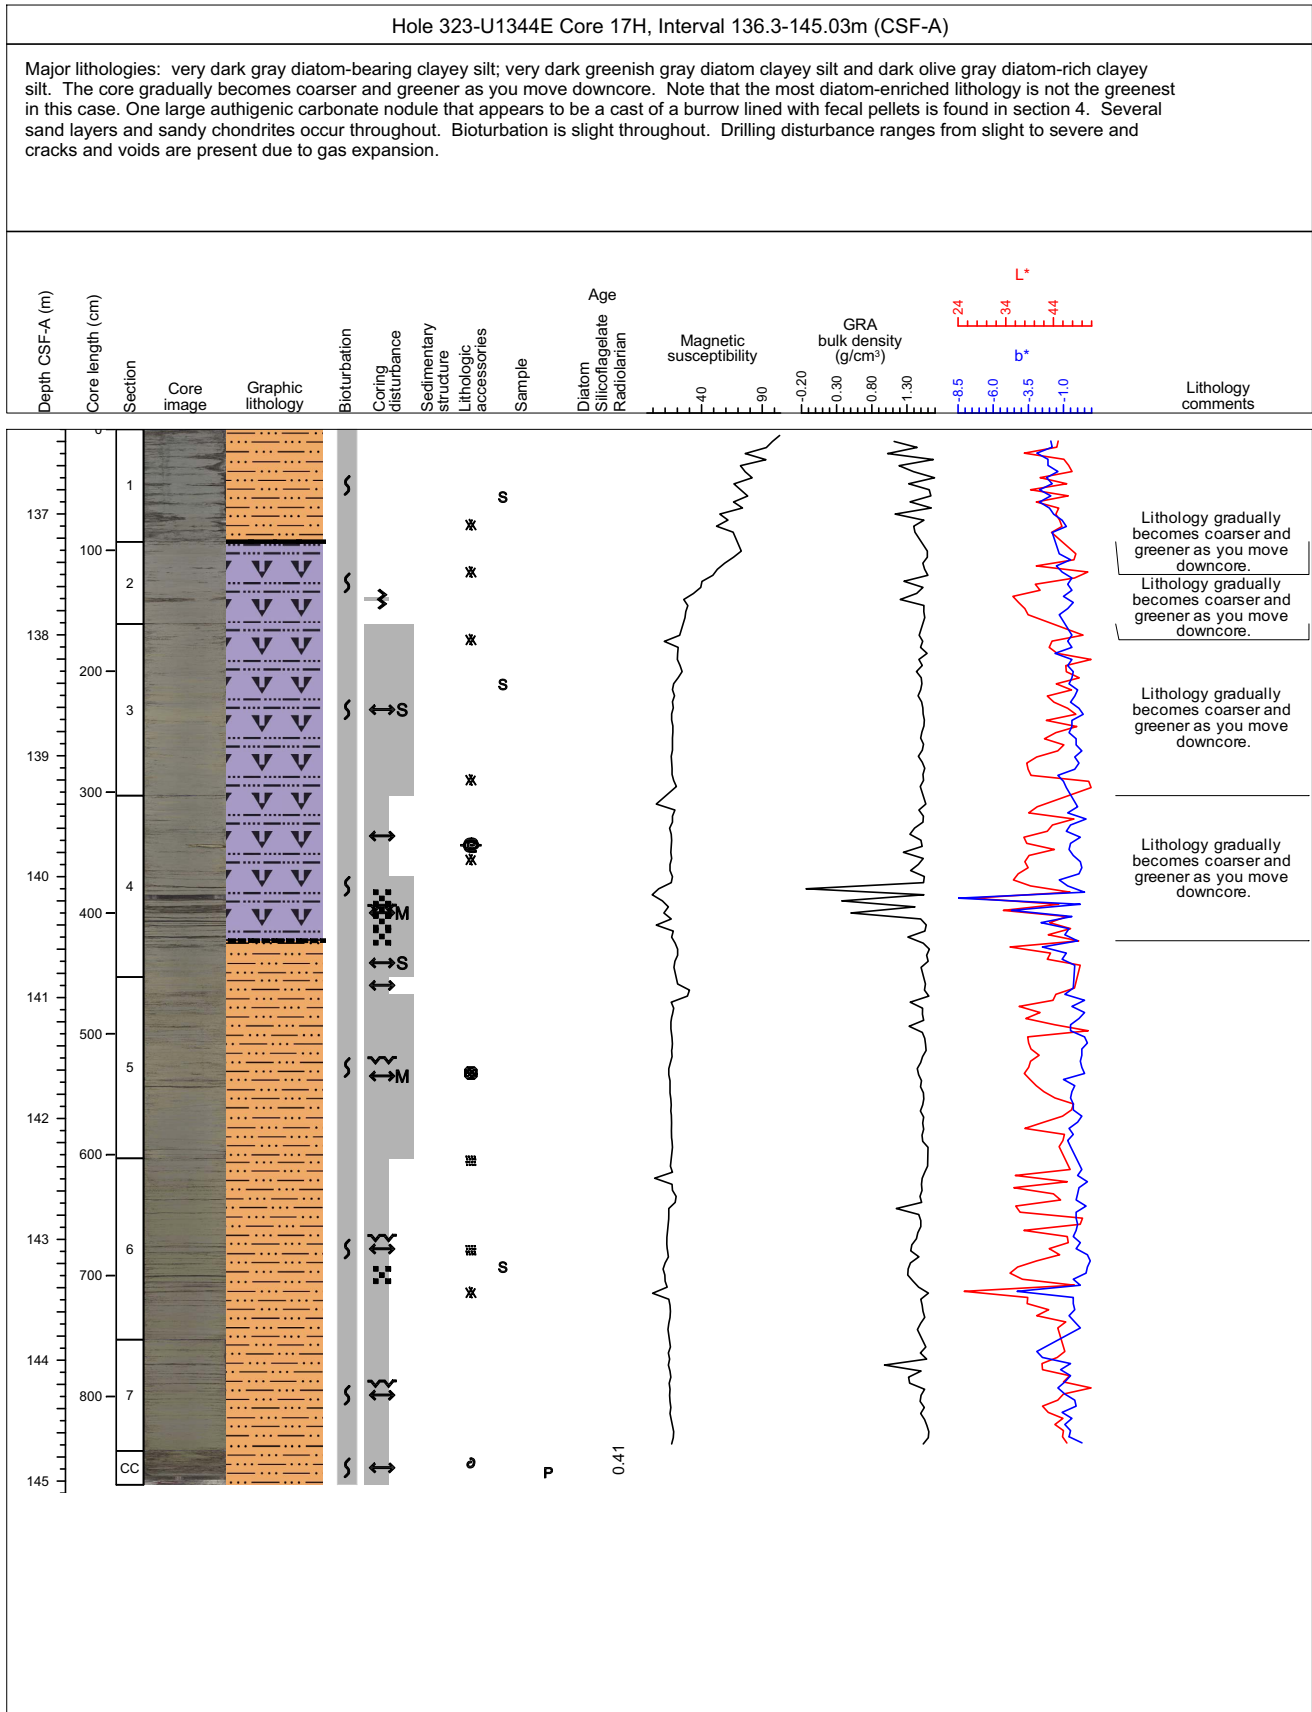

### Core Photo

Hole 323-U1344E Core 16H, Interval 126.8-136.51m (CSF-A)

Major lithology is diatom-rich clayey silt (dark greenish gray 10Y 4/1). Sandy layer occurred in Section 3 (71-73cm). Some sandy patches scattered through the core. Bioturbation is moderate.

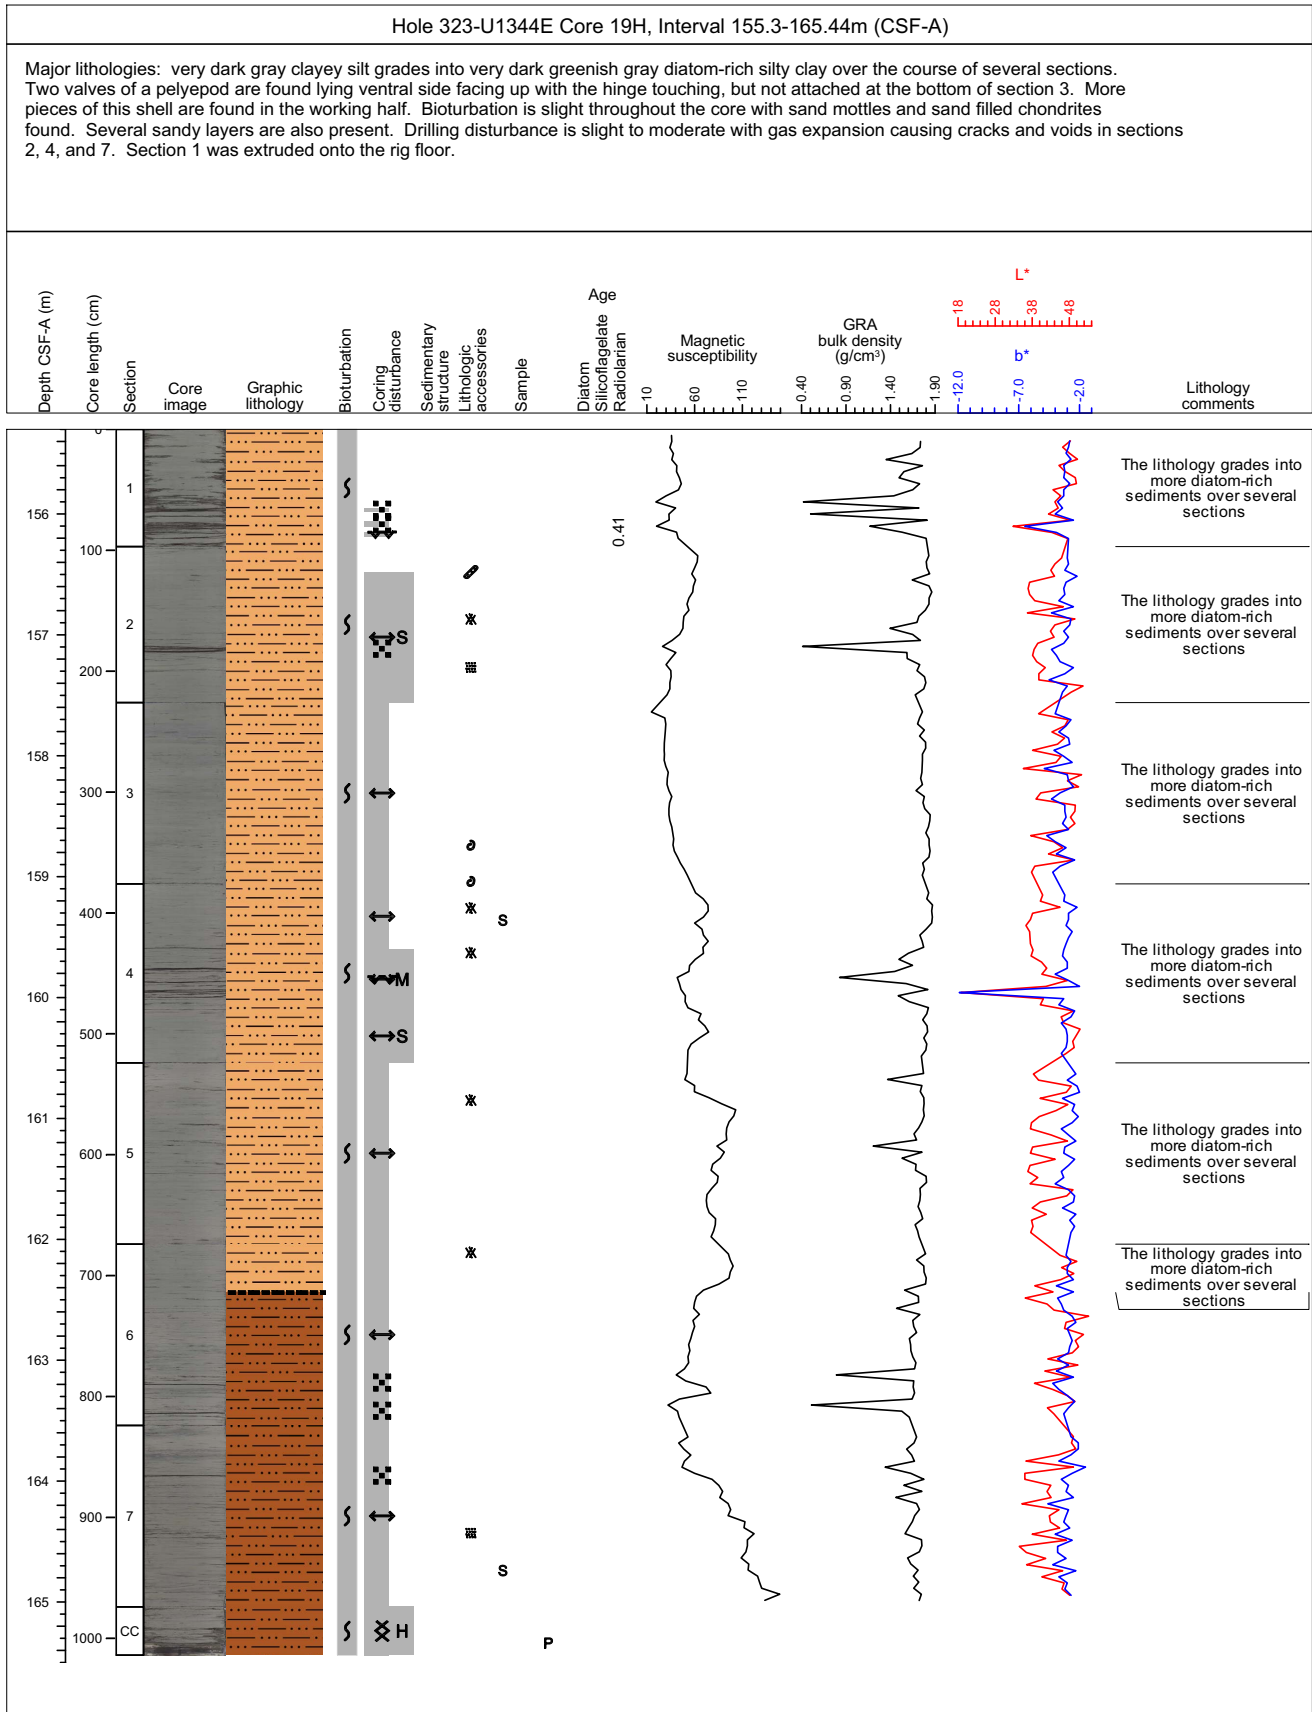

### Core Photo

### Core Photo

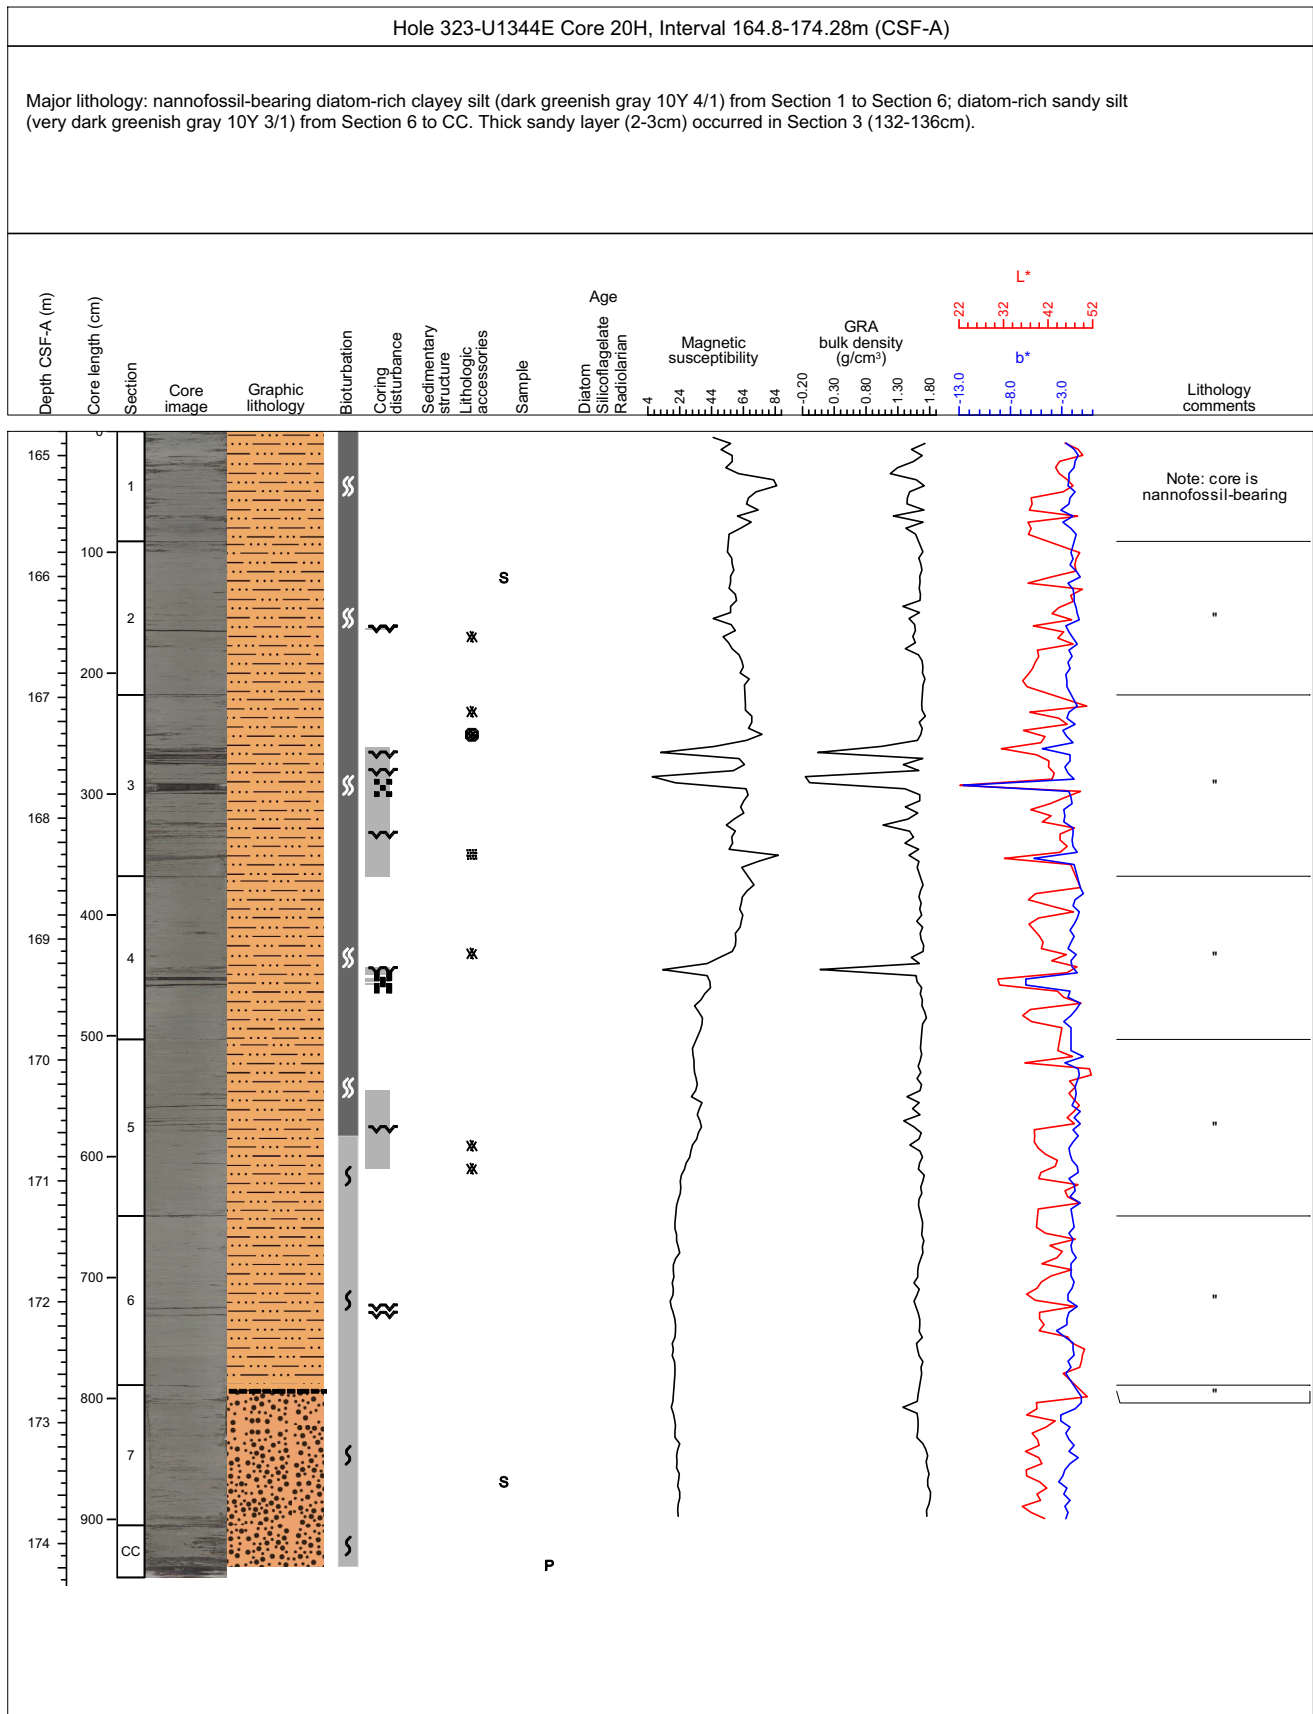

### Core Photo

### Core Photo

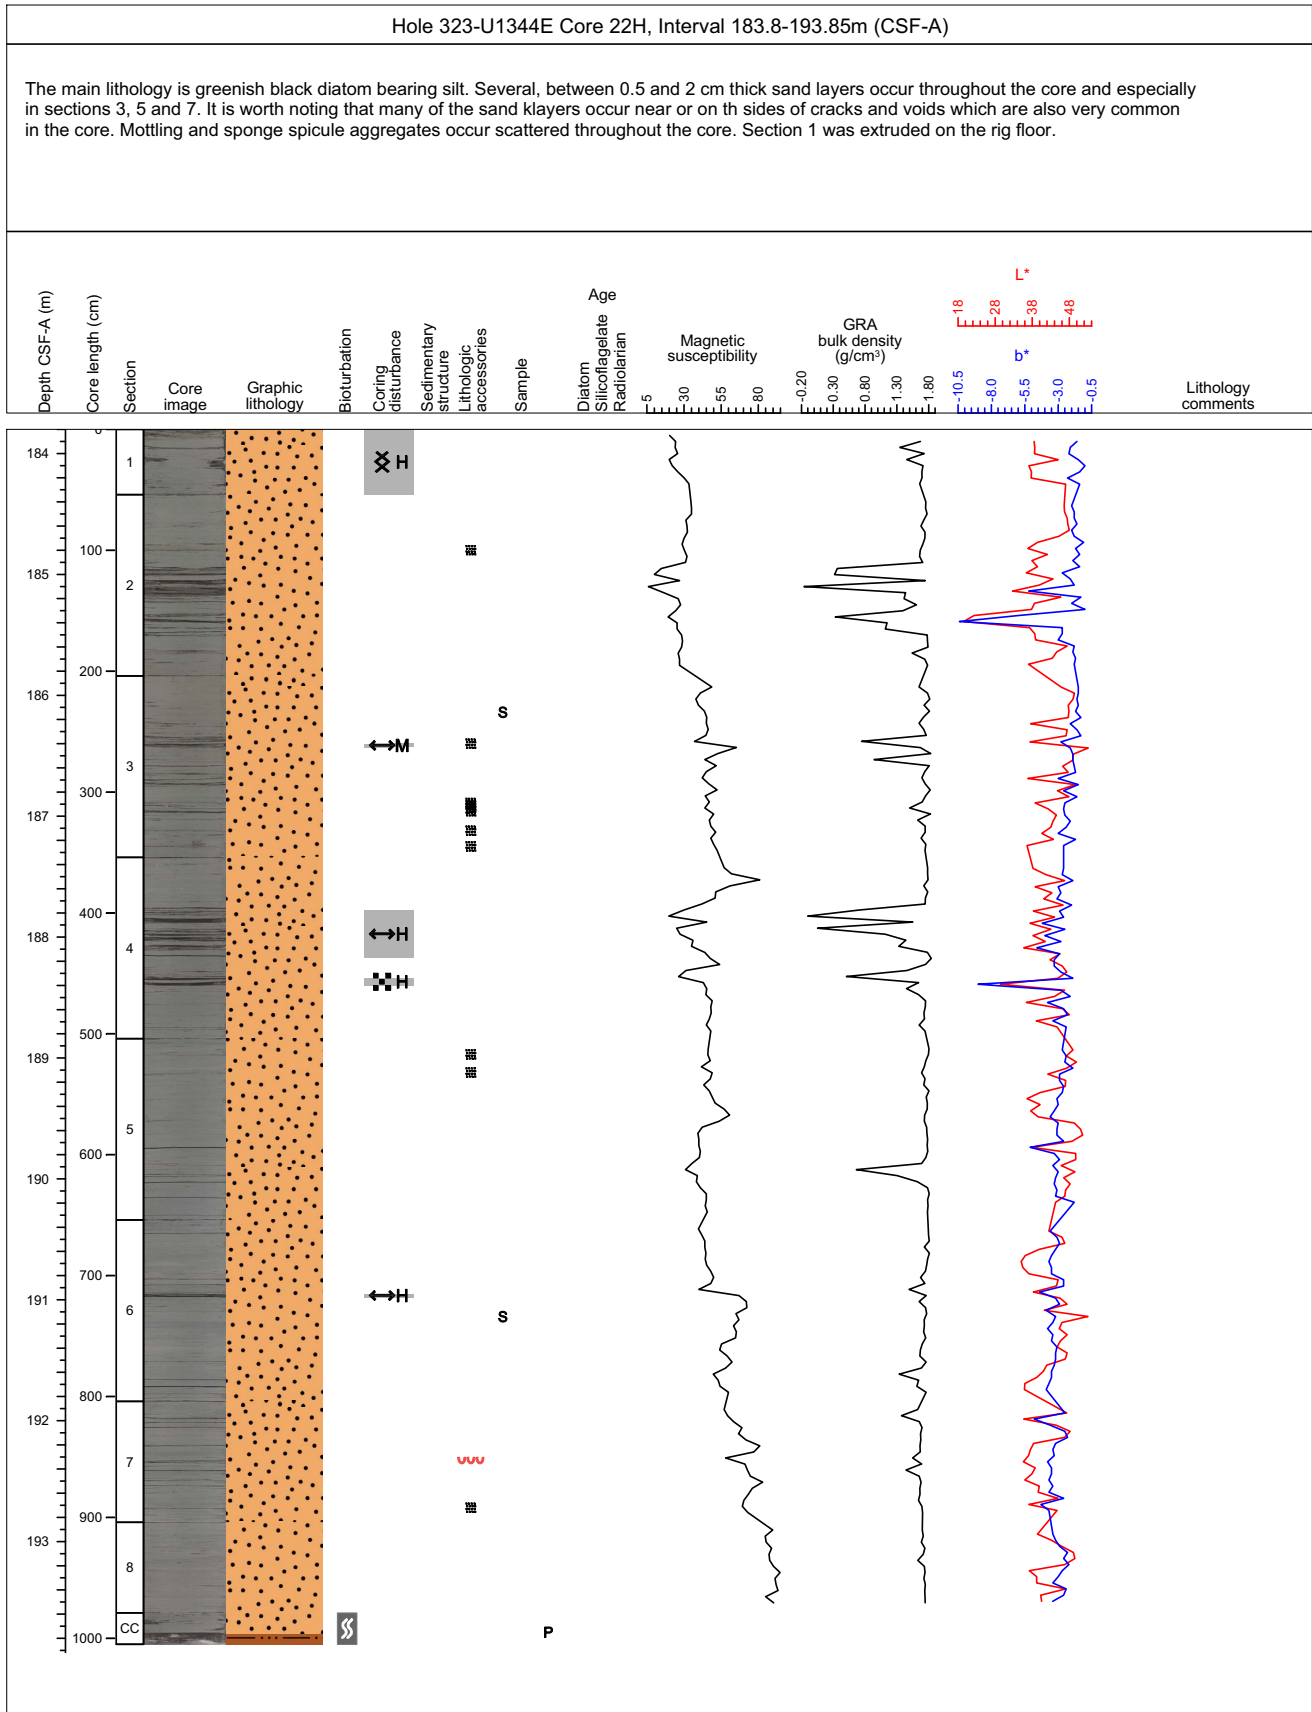

### Core Photo

Hole 323-U1344E Core 21H, Interval 174.3-182.62m (CSF-A)

Major lithology: very dark greenish gray diatom-bearing clayey silt. Secondary lithology: authigenic carbonate- and diatom-rich clayey silt. Bioturbation is slight throughout the core with many small sand mottles, sponge spicule aggregates, and a pelycepod valve all present. Two sandy layers occur; both have sharp upper and lower contacts and may indicate erosional surfaces. Drilling disturbance is slight to severe due to gas expansion; many cracks and voids occur.
