| 324 | U1346A | 4R | 1W | 119.8 | 119.8 | | 5 | | | 75 | | 1 | | 4 | | | | | | 1 | | | 7 | | 3 | | | 4 | | | | | (From uppermost limestone which is intruded by the basalt). Calcite dominated (85%); mostly fine sparite. Some nannofossils but not common. Opaque Fe-bearing minerals are small and generally tabular in shape (4%). Rare Glaucocrite (1%). Isolated grains of plagioclase are rare (1%). Looks like a reasonably deep carbonate deposit (no evidence for shells, sponges or other shallow water fauna). | | |
| 324 | U1346A | 4R | 1W | 120.5 | 120.5 | | 5 | | | 73 | | | | 5 | | | | | | 1 | | | 15 | | | | | 6 | | | | | (From limestone which is intruded by the basalt). Calcite dominated (85%); mostly fine sparite. 25% nannofossils. Clear crystals showing pale-green pleochroism and bright birefringence colours, with cleavage along the long axis (pyroxine?), are common (15%). Some radiolarians (6%) Opaque Fe-bearing minerals are small and generally tabular in shape (5%). Isolated grains of plagioclase are rare (1%). | | |
| 324 | U1346A | 4R | 2W | 121.2 | 121.2 | | 14 | | | 35 | | | | 1 | | 2 | | | 2 | | | 15 | | 30 | | | 0.5 | | | | | (From fine clay layer in turbidite). Carbonaceous claystone with volcanic glass. Angular volcanic glass - limited transportation distance from source. Ash-sized. | | | |
| 324 | U1346A | 4R | 2A | 121.3 | 121.3 | | 5 | | | 40 | | | | 4 | | | | | | | | | 10 | | 40 | | | | 1? | | | | | (from the turbidite sequence, slightly coarser layer). Lots of volcanic grains, calcite and siliceous biogenic remains. | |
| 324 | U1346A | 4R | 2W | 121.3 | 121.3 | | 10 | | | 7 | | | | 2 | | | | | | | | 3 | | 75 | | | | | | | | | (From fine clay layer in turbidite). Volcanic claystone. Almost pure sub-angular volcanic glass - limited transportation distance from source. Ash-sized. More orange alteration (?) colour in the glass than in slide 4R_2_53. | | |
| 324 | U1346A | 4R | 2A | 121.7 | 121.7 | | | | | 60 | | | | 5 | | | | | | | | 5 | | 30 | | | | | | | | | (from the base of the uppermost turbidite sequence, coarser layer). Lots calcite, some nannofossils, some volcanic grains and siliceous biogenic remains. All grains angular, short transport distance from source. | | |
| 324 | U1346A | 4R | 2W | 122 | 122 | | 6 | | | 11 | | | | | | | | | | | | 80 | | | | | | | | | | (from thin carbonate layer occluded to chert nodule). Nannofossil limestone. Some clay minerals and isolated green pleochroic crystals (pyroxine?). No obvious glass. | | | |
