Description

Dark greenish gray (10Y 4/1) sandy clayey silt w/ dispersed clasts with 0.5–1 cm thick fine–medium sand laminae (~~poorly~~ moderately well sorted); laminae are inclined and not planar, but irregular and disturbed; laminae occur in packages of 1–4 laminae, with laminae spaced ~2 cm apart

- rock clast at 33–34 cm
- disruption of laminae is not due to coring, possibly due to slumping (or bioturbation)
- possible shell fragments at 109–110 cm and ~~60–61 cm~~, 133–134
- gypsum? at 60–61 cm (smear slide)
