

Figure F1. Microbial enumerations determined in drilling fluid from outside the core during drilling operations, Hole M0077A. Microbial numbers reflect cell abundances in sea water and/or growth of cells in the additives that are mixed with seawater to produce the drilling fluid. Gray box = data range of counts taken within Expedition 364 samples. See Microbiology in the Expedition 364 methods chapter (Gulick et al., 2017) for sample preservation.
