Summary Description

Light greenish gray marl moderately mixed with dark gray tephra by bioturbation

Plane-polarized

46364201

Cross-polarized

46364251

SEDIMENT DETAILS**Lithology:** marl

Grain sorting: moderate [2014]

Cement form: microcrystalline

Sand [%]: 1 Silt [%]: 1 Clay [%]: 98

Detailed description

Ooids have traces of preserved concentric structure and nucleous with dense mineral. Most ooids are micritized. Bioturbation zone is rich in Fe/Mn oxide and opaque grains. The boundary of bioturbation and calcareous mudstone is dense minerals rich. Some grains are altered by serpentine. Olivine are present and some are altered by serpentine.

SEDIMENT DETAILS**Lithology:** volcaniclastic siltstone

Grain sorting: poor [2014]

Cement form: microcrystalline

Sand [%]: 20 Silt [%]: 60

Clay [%]: 20

Detailed description

Siltstone consists of sand to silt-size angular basalt and altered glass fragments within clayey matrix. Many greenish to transparent, sand to silt-size (0.15 mm) spherical grains are probably amygdalites liberated from vesicular basalt. Inside of these spherical grains are replaced by zeolite or clay minerals. But some of them are possibly radiolarians and foraminifers. There are many authigenic pyrite in the matrix.

Summary Description

Striated fault surface in marl, preserved in cross-section along the edge of the thin section.

Plane-polarized

46364161

Cross-polarized

46364181

MICROSTRUCTURES

Microstructure: fault rock

Rock name: Marl with slip surface

Microstructure comment: Recrystallised carbonate

Detailed description A striated fault surface has developed in a coherent, relatively homogeneous and isotropic marl. The fault surface is composed of fine, recrystallised carbonate in a sub-mm layer that is texturally distinct from the host rock. There are rare carbonate filled fractures, markedly two at a high angle to the fault zone that are traced through the sample. There are others, which are thinner and shorter, forming small anastomosing networks locally at a low angle to the fault surface.

Feature type	Observation	Intensity rank
Fracture abundance	rare	n/a

THIN SECTION LABEL ID: 375-U1520C-8R-1-W 4/6-TSB-TS07

Summary Description

Marl with fracture mesh

Plane-polarized

46364411

Cross-polarized

46364431

MICROSTRUCTURES

Microstructure: fracture

Rock name: Marl

Detailed description Fracture system in marl, with two sets of fractures filled by very fine grained green material. A dominant set appears to have a normal sense of shear, and is present throughout the section. A second set is locally present at sub-mm spacing and leads to creation of fine (< 0.1 mm edges) prismatic (in 2D) host rock clasts where the fracture sets cross.

Feature type	Observation	Intensity rank
Fracture abundance	common	n/a
Fault rock intensity	moderate fracturing	2

THIN SECTION LABEL ID: 375-U1520C-8R-2-W 70/72-TSB-TS08

Summary Description

Normal faulted carbonate layer in clay matrix

Plane-polarized

46364451

Cross-polarized

46364471

MICROSTRUCTURES

Microstructure: fracture

Rock name: Marl

Microstructure comment: Fracture boudinage

Detailed description Carbonaceous layer within a clay-rich interval ~ 2mm thick has been extended parallel to bedding by domino normal faulting. The faults are largely healed by carbonate recrystallisation.

Feature type	Observation	Intensity rank
Fracture abundance	common	n/a
Fault sense of shear	normal	n/a

Summary Description

Bedding parallel stylolites in bioturbated calcareous mudstone, crosscut by higher angle fine fractures

Plane-polarized

46435101

Cross-polarized

46435121

MICROSTRUCTURES

Microstructure:

Rock name:

Bioturbated calcareous mudstone

Microstructure comment: Pressure solution seam crosscut by thin filled fractures

Detailed description Fine, spaced stylolites are parallel to bedding, and crosscut by higher angle thin, carbonate filled fractures with rims. Host rock is very fine grained and bioturbated.

Feature type	Observation	Intensity rank
Fabric intensity	moderate	n/a
Fracture abundance	rare	n/a

Summary Description

Coarser clast in clay matrix with flow fabric

Plane-polarized

46450821

Cross-polarized

46450841

MICROSTRUCTURES

Microstructure: color banding

Rock name: Debris flow

Microstructure comment: Clast in debris flow

Detailed description Coarser clast within debris flow in chalk. Fossils appear largely undisturbed by flow, but are locally distorted by pressure solution. Irregular grain boundaries and minor interfingering of muddy and silty sediments attest to soft sediment flow. Strong fabric defined by preferential orientation of platy minerals.

Feature type	Observation	Intensity rank
Fabric intensity	moderate	n/a

Cemented volcaniclastic

Plane-polarized

46450861

Cross-polarized

46450881

MICROSTRUCTURES

Microstructure: vein

Rock name: Volcaniclastic conglomerate

Microstructure comment: Cemented volcaniclastic

Detailed description Carbonate precipitate forms a cement in conglomerate. Thin veins crosscut the cement.

THIN SECTION LABEL ID: 375-U1520C-25R-1-W 78/80-TSB-TS20

TS no.: 20

Requestor Group: Structure

Observer: AF

Summary Description

Massive, elongate blocky, horizontal tensile vein in volcanioclastic

Plane-polarized

46450901

Cross-polarized

46450921

MICROSTRUCTURES

Microstructure: vein

Rock name: Volcanioclastic conglomerate

Microstructure comment: Carbonate vein in volcanioclastics

Detailed description

Subhorizontal carbonate vein in volcanioclastic conglomerate cemented by other carbonate. The vein appears to contain elongate-blocky crystal at high angle to the vein margin, but the section is thick. Vein generally crosscuts the cement, but some cement may also be connected to the vein - difficult to tell in thick section.

THIN SECTION LABEL ID: 375-U1520C-25R-2-W 101/102-TSB-TS21

TS no.: TS21

Requestor Group: Structure

Observer: Juli
Morgan**Summary Description**

Volcaniclastic sediment with inclined fracture vein, banded black on vein edges to white center. Black pore filling disseminated within the wall matrix; zeolite fills remaining pore space; vein material not on thin section; volcanic clasts highly altered and locally fibrous, rimmed by phyllosilicate band.

Plane-polarized

46468021

Cross-polarized

Summary Description

Foliated carbonaceous mudstone with thin composite carbonate-zeolite veins

Plane-polarized

46468681

Cross-polarized

46468701

MICROSTRUCTURES

Interval domain no: Domain rel. abundance (%): Domain name: microfabric

Microstructure: vein Rock name: Carbonaceous mudstone

Microstructure comment: Foliated mudstone with thin carbonate-zeolite veins

Detailed description Foliated mudstone with sub-mm foliation spacing. Fine grained secondary mineral growth around the edges of clasts within the mudstone, typically symmetric to weakly asymmetric. Thin veins are composed of fine grained carbonate and zeolite, with no particular pattern or cross-cutting relationships. A few veins abut a carbonate structure that comprise aligned inoceramid prisms..

Feature type	Observation	Intensity rank
Fracture abundance	rare	n/a
