THIN SECTION LABEL ID: 392-U1580A-45R-1-W 130/133-TSB-TS 11
Thin section no.: 11
Observer: PD
Piece no.: 1
Unit/subunit: 1
Thin section summary: Sample U1580A-45R-1W 130/133 is a highly altered basalt. Half of the sample is aphanitic and the other half is fine grained. Only plagioclase and oxides remain in the groundmass. Phenocryst pseudomorphs of potentially olivine exist in the fine grained half, these are completely replaced with philosilicates.

Thin section summary: Sample U1580A-45R-2W 70/72 is a plagioclase olivine-phyric basalt. Phenocrystic olivine has been recognized only by its pseudomorphs which are now completely replaced with clay minerals. Most of the clinopyroxene is also replaced by clay minerals. One plagioclase phenocryst is present and the groundmass plagioclase is partially altered.

Observer: PD
Thin section no.: 14
Piece no.: 1
Unit/subunit: 2
Thin section summary: Sample U1580A-47R-2W 54/57 is an aphyric basalt. It is highly altered with only groundmass plagioclase and oxides surviving. The opaque oxides are the largest groundmass phase, larger than the plagioclase. Very little clinopyroxene in the groundmass survives, and everything else is unidentifiable alteration products.

THIN SECTION LABEL ID: 392-U1580A-66R-3-W 0/3-TSB-TS 22
Observer: PD
Unit/subunit: 10b

Thin section summary: Sample U1580A-66R-3W 0/3 is a doleritic basalt. It is coarse grained with plagioclase laths averaging 2.5mm and clinopyroxene and olivines averaging 2mm. Olivines are completely replaced but show nice pseudomorphs replaced with clay minerals. The interstitial material is also completely altered.

Plane-polarized: Cross-polarized:

Igneous Petrology

Lithology: dolerite

Groundmass grain size (avg): coarse-grained

Texture 1: equigranular
Texture 2: aphyric

THIN SECTION LABEL ID: 392-U1580A-67R-1-W 23/26-TSB-TS 23  Thin section no.: 23
Observer: PD  Piece no.: 2
Unit/subunit: 10b

Thin section summary: Sample U1580A-67R-1W 23/26 is a doleritic basalt. It is coarse grained and moderately altered. Plagioclase is fresh and the laths average 2mm. Oxides in the groundmass are quite large averaging about 1.5mm. The clinopyroxenes are somewhat altered. All olivine is completely altered as is the interstitial material.
