

THIN SECTION LABEL ID:	396-U1571A-22R-2-W 75/78-TSB-TS39	Thin section no.:
Observer:	Sarah Lambert	Piece no.:
Thin section thickness:	30	Unit/subunit:
Thin section summary:	fine-grained glomeroporphyritic basalt with cluster of plagioclase and minor clinopyroxene phenocrysts. The groundmass is mostly composed of plag (50%) and cpx (30%) and clay mineral. The basalt is highly vesicular and the vesicles are filled with clay minerals.	

Igneous Petrology

Lithology: moderately plagioclase phric basalt Groundmass grain size (avg.): fine-grained
 Texture: holocrystalline Grain size distribution: seriate

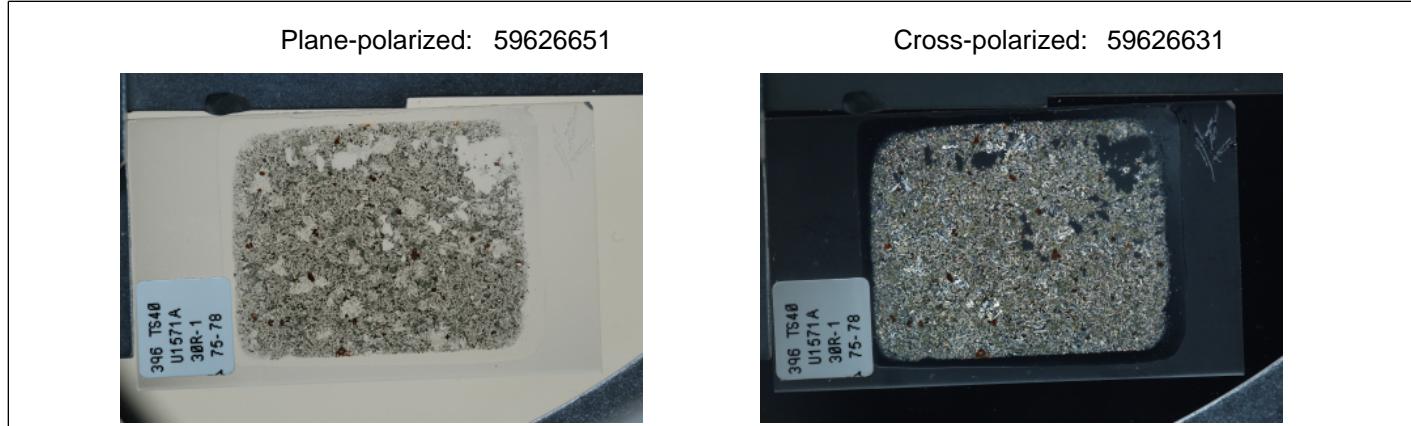

Phenocrysts	Original (%)	Present (%)	Replaced (%)	Size min. (mm)	Size max. (mm)	Shape	Habit	Comments
Plagioclase	12				5	subhedral	tabular	
Groundmass	Original (%)	Present (%)	Replaced (%)	Size min. (mm)	Size max. (mm)	Shape	Habit	Comments
Plagioclase		50				subhedral	elongate	
Clinopyroxene		30				anhedral	equant	

Alteration

Alteration intensity: slight Total alteration (%): Recrystallization extent: weak

Vesicle fill composition	Percent
Total vesicle fill	90

THIN SECTION LABEL ID:	396-U1571A-30R-1-W 75/78-TSB-TS40	Thin section no.:
Observer:	Sarah Lambert	Piece no.:
Thin section thickness:	30	Unit/subunit:
Thin section summary:	sparsely olivine plagioclase phric fined grain basalt. The groundmass is mostly composed of millimetric plagioclase and submillimetric cpx. The plagioclase phenocrysts (2-3mm) often form clusters. The olivine phenocrysts (1-2mm) are completely replaced by iddingsite. The sample is moderately vesicular with 50% vesicles filled with clay minerals.	

Igneous Petrology

Lithology: olivine-plagioclase phric basalt Groundmass grain size (avg.): fine-grained
 Texture: holocrystalline Grain size distribution: seriate

Phenocrysts	Original (%)	Present (%)	Replaced (%)	Size min. (mm)	Size max. (mm)	Shape	Habit	Comments
Plagioclase	5				4	subhedral	tabular

THIN SECTION LABEL ID:	396-U1571A-35R-1-W 94/98-TSB-TS43	Thin section no.:
Observer:	Sarah Lambert	Piece no.:
Thin section thickness:	30	Unit/subunit:
Thin section summary:	strongly altered highly vesicular aphyric basalt. The groundmass crystallinity changes from cryptocrystalline to microcrystalline, highlighting flow texture. The groundmass is mostly composed of plagioclase and clay minerals. The submillimetric vesicles are filled with saponite.	

Igneous Petrology

Lithology: aphyric basalt Groundmass grain size (avg.): microcrystalline
 Texture: aphanitic Grain size distribution: seriate

Groundmass	Original (%)	Present (%)	Replaced (%)	Size min. (mm)	Size max. (mm)	Shape	Habit	Comments
Plagioclase				0.5		subhedral	elongate	

Alteration

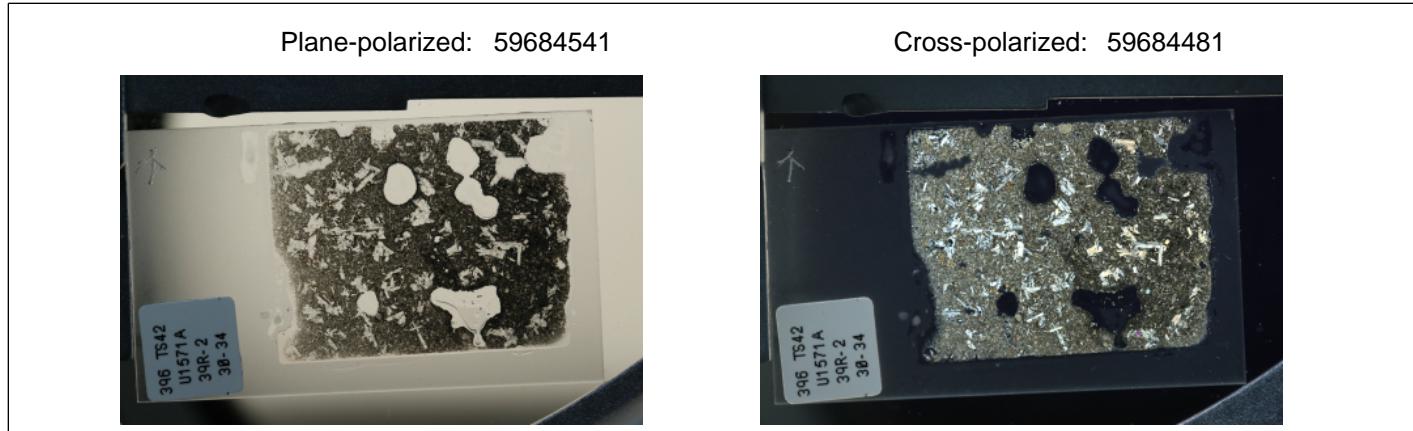

Alteration intensity: high Total alteration (%): Recrystallization extent: strong

Vesicle abundance (%): 50 Vesicle shape: rounded Vesicle distribution:

Vesicle min. size (mm): Vesicle max. size (mm): 2 Vesicle mode size (mm): 0.5

Vesicle fill composition	Percent
Total vesicle fill	100
Clay, saponite	100

THIN SECTION LABEL ID:	396-U1571A-39R-2-W 32/34-TSB-TS42	Thin section no.:
Observer:	Sarah Lambert	Piece no.:
Thin section thickness:	30	Unit/subunit:
Thin section summary:	highly vesicular moderately plagioclase phric basalt with minor phenocrysts of euhedral olivine (replaced by iddingsite and clay minerals) and anhedral clinopyroxene. The groundmass is microcrystallized and mostly composed of plagioclase and cpx. Strong recrystallization in clay minerals (saponite) is observed. Vesicles are empty and surrounded.	

Igneous Petrology

Lithology: moderately plagioclase phric basalt Groundmass grain size (avg.): microcrystalline

Texture: holocrystalline Grain size distribution: bimodal

Phenocrysts	Original (%)	Present (%)	Replaced (%)	Size min. (mm)	Size max. (mm)	Shape	Habit	Comments
Plagioclase	10				3	subhedral	tabular
